ABSTRACTS:—

Marriages Registered in England in each of the Registration Divisions, Counties, and Districts in 1871; distinguishing those according and those *not* according to the Rites of the Established Church; in each quarter of the year; and distinguishing also Persons married according to their conjugal Condition, Minority, and Signature of the Register by marks 2–25

Ages of 270,028 Persons married in 1871, distinguishing those of Bachelors, Spinsters, Widowers, Widows . . 26–28

ABSTRACTS—*continued.* PAGES

MARRIAGES, BIRTHS, and DEATHS Registered, and Excess of Births over Deaths, in each of the Divisions, Counties, and Districts in 1871; also BIRTHS and DEATHS and EXCESS of BIRTHS over DEATHS in each of the Sub-districts of England; distinguishing the Sexes and Illegitimate Births throughout 30–84

BIRTHS Registered in the DIVISIONS and COUNTIES (distinguishing Males and Females) in each of the Four Quarters of 1871 . . . 86–89

BIRTHS of Children born out of Wedlock Registered in the DIVISIONS and COUNTIES (distinguishing Males and Females) in each of the Four Quarters of 1871 90–93

DEATHS Registered in each of the Four Quarters of 1871 (distinguishing Males and Females), in DIVISIONS and COUNTIES . . . 94–97

DEATHS in Public Institutions in 1871, and Special Inmates enumerated therein at the Census, 1871 99–117

DEATHS of Males and Females at different AGES Registered in 1871 in DIVISIONS, COUNTIES, and DISTRICTS 120–141

CAUSES of DEATH of Males and Females in ENGLAND, at different Periods of Life, in 1871 144–149

SUPPLEMENTARY TABLE of CAUSES of DEATH of Males and Females, in England at different Periods of Life, in 1871 150–153

CAUSES of DEATH of Males and Females in LONDON, at different Periods of Life, in 1871 154–159

CAUSES of DEATH of Males and Females in ENGLAND, and in each of the DIVISIONS and COUNTIES, in 1871 160–183

DEATHS from SEVERAL ZYMOTIC and OTHER CAUSES in 1871, in the DIVISIONS, COUNTIES, and DISTRICTS of ENGLAND . . . 184–195

VIOLENT DEATHS in ENGLAND and the ELEVEN DIVISIONS in the Year 1871, distinguishing SEX and AGES 196–205

DEATHS returned as having occurred from SUICIDE in ENGLAND and the ELEVEN DIVISIONS in the Year 1871, distinguishing SEX and AGES . 206–209

DEATHS returned as having occurred from MURDER and INFANTICIDE in ENGLAND and the ELEVEN DIVISIONS in the Year 1871, distinguishing SEX and AGES 210–212

DEATHS returned as having occurred from MANSLAUGHTER in ENGLAND and the ELEVEN DIVISIONS in the Year 1871, distinguishing SEX and AGES . 213–215

REPORT

TO

The Right Honourable JAMES STANSFELD, M.P., President of the Local Government Board, &c., &c.

General Register Office, Somerset House,
26th May 1873.

SIR,

I HAVE the honour to submit to you my Report on the Registration of Marriages, Births, and Deaths for the year 1871.

The general results are more satisfactory than those of the year preceding. The marriages increased; and this implies that the young marriageable people of the country were prosperous. The births exceeded, the deaths were fewer than, those of the preceding year. There is only a slight decrease in the number of the men and women who sign the marriage register with marks, through inability to write their names at all, or at least legibly. There is a steady increase of marriages at the Superintendent Registrars' offices; the numbers were ninefold those in 1841. At the Established Church the marriages by licence have steadily decreased since 1865, while the marriages after banns have increased nearly to the same extent. The Roman Catholic marriages attained their highest numbers in 1866, declined during 1867–8-9, and have since slightly increased.

The most important deductions in my Report are drawn from a comparison of the registered facts with the population enumerated; and having now determined by the analysis of the Census returns not only the numbers living, but their ages, I am able to show the mortality of persons of both sexes at 12 different groups of ages for each of the 34 years 1838–1871. This is one of the most important series of facts relating to the life of a nation ever published; and it is worthy of remark that the mortality at the several ages for the 34 years differs little from the mortality of the 17 years, 1838–54. The mortality of males at all ages was 2·33 per cent. in 1838–54, and 2·33 per cent. in 1838–71; of females for the same periods, 2·16 and 2·15.

Annual Mortality PER CENT. of **Males** and **Females** in **England** and **Wales.**

Ages.	Males.		Females.		Ages.
	1838–54. (17 Years.)	1838–71. (34 Years.)	1838–54. (17 Years.)	1838–71. (34 Years.)	
All Ages	2·33	2·33	2·17	2·15	All Ages.
0–	7·25	7·26	6·23	6·27	0–
5–	·92	·87	·91	·85	5–
10–	·52	·49	·54	·50	10–
15–	·82	·78	·85	·80	15–
25–	1·00	·99	1·06	1·01	25–
35–	1·28	1·30	1·27	1·23	35–
45–	1·85	1·85	1·59	1·56	45–
55–	3·18	3·20	2·82	2·80	55–
65–	6·69	6·71	6·00	5·89	65–
75–	14·76	14·71	13·44	13·43	75–
85–	30·14	30·55	27·92	27·95	85–
95 & upwards	44·03	44·11	43·22	43·04	95 & upwards.

Note.—The Table may be read thus :—Of males of the age 25 and under 35 the rate of mortality *per cent.* was 1·00 in 17 years 1838–54; and ·99 in 34 years 1838–71, and so for other ages. The rates of mortality for 1838–54 are taken from the English Life Table, pp. xviii–xx; the rates for 1838–71 are the arithmetical means of the several rates for each of the 34 years, as shown in Tables 21–4, pp. lxxx–iii.

The coincidence between the rates of mortality at the ages when insurance is effected are equally remarkable. This is a decisive proof of the solid foundation of the English Life Table, which was calculated on the population living at two censuses, and on 6,470,720 deaths; for the rates are in complete accord with the rates deduced from the living at four censuses, and from 14,330,919 deaths, distinguishing the numbers living at 12 ages into which human life is divided in our tables, science being no longer contented with the seven ages of the old times.

The mean lifetime of the English people is by the table 40·86 years. That is the average number of years children born in England live.

It is gratifying to me at the end of 34 years to be able to say that one of the objects for which registration was established has been accomplished, and that the expectations held out in the following passage of the first Report from this office have been realised :—

" The recommendation of the Report " [of the Select Committee of the House of Commons on Friendly Societies in 1827, pointing out the insufficiency of the data hitherto collected, and the contradictory nature of the several Life Tables founded on them], " that measures be adopted " for making ' an accurate and extensive collection of facts,' whereby may " be facilitated ' the solution of all questions depending upon the duration " ' of human life,' is at length carried into effect; ample materials, thus " conducing to ameliorate the condition of the working classes, are now " afforded in the certified copies of registers deposited in the General " Register Office, and each year's accumulation will increase the value " of such records, by augmenting the number of facts upon which calcu- " lation may be brought to bear."*

The National Table is, it will be seen, a safe basis for the insurance of lives, as it includes all the population; and in the degree that persons living in unfavourable conditions, or labouring under disease are excluded, will be the proportion of profits dependent on the mortality.

* First Report of Registrar General for year ending 30th June 1838, p. 16.

The returns will enable us to follow any improvements in the state of the public health. Hitherto, the sanitary works of the country have been partial, and have been confined to places where the local authorities have displayed extraordinary energy; in some places, such as Manchester, Salford, and Glasgow, the water supply is good, but other grave defects counteract its results; in other places, as in South London, the water supply and the drainage have been greatly improved with the best effects; in other districts the main drainage has been carried out effectually, but the subsidiary drains and the house drains are imperfect: and the population outside drained towns is increasing rapidly without a system of sewerage, and often with a bad water supply; dwelling houses are still crowded; the state of the small towns, the villages, the farmyards, and of many of the cottages remains much as it was; and whole regions of great counties are in 1871 in a condition as unsatisfactory as they were in 1838.

What was wanted was administrative machinery, which will now be supplied by the new Sanitary Act to the whole country; and I shall watch with interest, and endeavour to record with impartiality, the results of its operation.

Increase of Population.—The finally revised results of the eighth decennial Census show that on the 3rd April 1871 the total population of England and Wales was 22,712,266, having increased by 2,646,042 persons, or at the rate of 13·19 per cent. since the Census of 1861. This is the largest decennial increase, relatively as well as actually, that has taken place since 1831–41; and some, at least, of the causes which have led to this arrest of the tendency of the population to increase at the decreasing rate observed from 1811 to 1861 will no doubt be elucidated when the analysis of the conditions, occupations, and birth-places of the people is completed. But the effect of a particular cause or set of causes in augmenting or diminishing the rate of increase between any periods can at the utmost be traced approximatively so long as the marriage, birth, and death registers, an obviously defective record of emigration, an entire absence of knowledge respecting immigration, and a Census taken once only in every ten years are the sole available guides. The interest of the public at large in statistical inquiry is as yet undeveloped sufficiently to justify an attempt to establish a Population Register,* or a record of the migration of every person going into or coming from Scotland, Ireland, or elsewhere beyond seas; and it is of little use to speculate upon the nearness or remoteness of the probability of obtaining statistics complete enough to demonstrate the part played by each of the many factors concerned in producing a growth or decline of the population.

Regard being had to disturbing elements, it is apparent as a broad general deduction from the facts that the population of England and Wales at the Census of 1871 was greater by 590,186 persons than it would have been had the increase between 1861 and 1871 been dependent solely upon the balance between the natural growth or excess of births over deaths and the recorded emigration. During the 10 years the births exceeded the deaths by 2,705,598, from which, deducting

---

* Population Registers are kept in Sweden, Belgium, and Holland. By a decree of His Majesty the King of Italy, dated 4th April 1873, a Register of the fixed population is to be established in that country: it is to consist of three parts, one relating to houses, one to families, and one to individuals. For each person the register is to show the name, surname, and sex; the names of his parents; the place and date of his birth; his civil condition, whether single, married, or widower, and if married the name of his wife, ulterior changes of condition being duly posted up; his rank, profession, or occupation; his residence; his declared civil domicile; and a reference to the folio relating to families under which he will be found inscribed.

649,742 persons of English origin reported to the Emigration Commissioners as having sailed from this country within the decennium, there is a residue of 2,055,856 which would have approximatively represented the difference between the enumerated population in 1861 and 1871 supposing there had been no immigration. On an average of the 10 years the annual excess of births was 270,560, the annual number of emigrants, 64,974; and to account for the actual population discovered in 1871 it is obvious that the influx of Scotchmen, Irishmen, or foreigners, or of Englishmen returned to their native land, must have averaged about 59,019 per annum.

For statistical purposes, the population is estimated to the middle of the year on the basis of the rate of increase ruling between the preceding Census periods; in this way, the 22,712,266 persons enumerated on 3rd April 1871 are estimated to have increased to 22,782,812 by the middle of the year.

It is satisfactory to know that the estimates of population on which the rates of marriage, birth, and death in all England have been calculated since 1861 for my Reports have been proved by the enumeration of 1871 to have approximated so nearly to the truth that at the end of 10 years the difference between the actual and estimated population amounted to less than 500,000, which is equivalent only to a difference of 0·48 per 1,000 in the rate of mortality for 1871 calculated on the true numbers.

Meteorology.—The principal meteorological features of 1871, as described by Mr. Glaisher, were the unusually warm temperatures during February and March, the cold inclement weather during May and June, the extremely low temperatures recorded during the early portion of December, and the scarcity of rain during the last quarter of the year. The mean temperature of the air at the Royal Observatory, Greenwich, was 48°·7, exactly the same as in 1870, but nearly one degree below the average of 23 years. The rainfall amounted to 22·3 inches, or nearly 4 inches more than in 1870, but 1·6 inch less than the average. Mr. Glaisher remarks that although the meteorological values naturally varied considerably in the different localities whence returns are received, "so far as concerns the excess or deficiency above or below the average, "the observations at the Royal Observatory may be taken as generally "applicable to the whole country." (*See* pp. lvi–lvii and xciv–xcvii.)

Prices.—I have frequently remarked on the intimate relation in which the prices of the principal articles of food stand to the health and well-being of the population, as evidenced in the returns of births, deaths, and marriages. It has been shown in my Reports that the rate of marriage among the lower classes is to a large extent influenced by the price of wheat; the marriages, by a natural law, determine the birth-rate, which in its turn becomes one of the factors that in combination determine the death-rate; and thus the sequence of events by which the life of communities is sustained, completes itself.

The fluctuations in the prices of wheat, meat, and potatoes during each of the 20 years, 1852–71, are shown in Table 30 (p. lxxxviii). Derived from authentic sources as matters of fact, the results are unquestionable, whatever difference of opinion may arise as to the inferences deducible from them. Thus in the year 1852, when as yet the long European peace was unbroken, the average price of wheat per quarter was 40*s.* 10*d.*; the average price per pound of beef by the carcase was $4\frac{1}{8}$*d.*, of mutton $4\frac{7}{8}$*d.* In the succeeding five years, 1853–7, covering the period of the Russian War and the Indian Mutiny, wheat averaged 65*s.* 1*d.* the quarter, beef $5\frac{3}{8}$*d.* per pound, mutton $5\frac{7}{8}$*d.* per pound. During the three years 1858–60 the

Chinese and New Zealand Wars were in progress, and the price of wheat was 47*s.* 1*d.* per quarter, of beef $5\frac{3}{8}$*d.*, and of mutton $5\frac{6}{8}$*d.* per pound. Then followed the American Civil War and the Lancashire Cotton Famine, 1861–4, when wheat was 48*s.* 11*d.* per quarter, beef $5\frac{2}{8}$*d.* per pound, and mutton 6*d.* From 1865–7 the Cattle Plague ravaged the herds of Great Britain, and a great crisis in commercial affairs occurred; wheat in this period averaged 52*s.* per quarter, beef $5\frac{6}{8}$*d.* per pound, and mutton $6\frac{5}{8}$*d.* In the four years 1868–71 wheat was 53*s.* 11*d.* per quarter, beef $6\frac{1}{8}$*d.* per pound, and mutton $6\frac{3}{8}$*d.* Comparing the averages of these several periods, it appears that as between the initial year 1852 and the final period 1868–71, the price of beef has increased 47 per cent., and of mutton 30 per cent.; of this increase two thirds arose in the Russian War period, beef having increased since 1853–7 by about 13 per cent., and mutton by 9 per cent. only. A rise of 9 per cent. in the prices of both beef and mutton occurred in the Cattle Plague period, since which time beef has very slightly risen in price, while mutton has become cheaper.

The quantity of dead meat imported into Great Britain from foreign countries and British possessions abroad increased from 495,253 cwts. in 1859 to 1,988,890 cwts. in 1871, or 300 per cent.; preserved Australian meat began to be largely imported in 1867, and amounted in 1871 to about one eighth of the total importation of dead meat.

The Report of the Veterinary Department for the year 1872, lately issued, contains much interesting information about the meat supply of this country. From this Report I gather that 18,022,973 cwts. of meat were consumed in Great Britain during the year 1870, yielding an average consumption of 78 lbs. per head of the whole population; and that as regards beef an increase in the price of late years has not been confined to Great Britain, but has taken place in continental countries also.

It is to be regretted that no data exist, at least within my knowledge, for determining in a sufficiently satisfactory manner to what extent the general rise in the price of meat is caused by its increased use amongst the industrial classes in this country. Individual observation goes to show that the daily food of the average artizan or mechanic consists much more largely of flesh meat than used to be the case, but how far this affects the price, whether in greater or less degree than an increased cost in the production of the 67 per cent. of the total supply which is home grown, is but at best conjectural. There can be little doubt that the general rise of prices is consequent upon a depreciation in the value of money.

Pauperism.—The average weekly number of paupers relieved during the year 1871 was 143,605 in-door, and 803,797 out-door, being a diminution on the numbers for 1870 of 5842 in-door, and 23,310 out-door. In the year 1852 the paupers (in and out door) relieved constituted 5 per cent. of the whole population; in the four years 1868–71 the proportion was 4·7 per cent. On the other hand, the cost of poor relief increased from 5*s.* $4\frac{1}{2}$*d.* per head of population in 1852 to 7*s.* in the last four years.

Marriages.

The number of persons married during the year was 380,224, or 16,914 more than in the previous year, and 26,284 more than in 1869. In the 34 years 1838–71 the mean annual ratio of persons married was 16·5 to every 1000 persons living: in 1871 the ratio was 16·7, being higher than in either of the four preceding years, but less by ·6 per 1000 than the mean annual ratio in the four years 1863–66. Some parts of the country did not participate in the increased marriage-rate of 1871; in the parts

of the counties of Surrey and Kent outside the Metropolitan limits, in Berkshire, Essex, Dorset, Devon, Somerset, South Wales, and North Wales, the rate was virtually the same as in 1870; in Oxfordshire, Cambridgeshire, Herefordshire, Salop, Northumberland, and Westmorland, there was a falling-off in the rate. The most marked increase occurred in the counties of Cumberland, Hertford, Nottingham, Warwick, Huntingdon, Bedford, Derby, and Worcester.

Forms of Marriage.—It is interesting to look back over the returns for what has now become a long series of years, and note the changes that have taken place in the rites or forms adopted for the legal ratification of the marriage contract. Thus in the five years 1841–45 nearly 92 per cent. of all the marriages registered in England were solemnized according to the rites of the Established Church; in the quinquennium 1866–70 the proportion was 77 per cent., and in the year 1871 it was 76 per cent.

On the other hand, marriages in the Superintendent Registrars' offices, involving no religious ceremony whatever, have steadily increased from 2·3 per cent. of the total in 1841–45, to 8·9 per cent. in 1866–70, and to 9·7 per cent. in 1871. The corresponding proportions of marriages in the registered places of worship of Roman Catholics and of other Christian denominations for the same periods were 5·9, 13·9, and 14·0 per cent.; while of Jews and Quakers marrying the proportion remained nearly constant at about ·2 per cent. These facts cannot fairly be regarded as measuring a decline in the influence of the Established Church, because it has to be remembered that the effect of the Registration Act in breaking down the exclusive privilege of solemnizing marriage previously enjoyed by the Church was small at first, the English people being at all times slow to abandon the old ways in which they and their forefathers have walked; while reasons apart from general religious belief may now sometimes induce professing members of the Established Church to avail themselves of the simple legal formality of the Superintendent Registrar's office.

Of the 144,663 marriages solemnized in 1871 according to the rites of the Established Church, ·01 per cent. were by special licence, 11·7 per cent. by ordinary licence, 84·3 per cent. after proclamation of banns; 2·9 per cent. by certificates of Superintendent Registrars, and as regards one per cent. the returns do not show whether the marriage was by licence, banns, or certificate.

As a proof of the great advance towards accuracy which the marriage returns of the clergy now exhibit, it is worthy of note that in the five years 1841–5, the proportion of cases in which the nature of the precedent formality was not stated was 15·9 per cent.; in the succeeding five years it was 12·2 per cent.; in the next quinquennium 4·1 per cent.; and so gradually falling to the one per cent. of 1871. Marriages by special licence fluctuate between 8 or 9 and 23 or 26 in a year, but taking groups of five years the proportion is tolerably constant at about ·01 per cent. The use of the ordinary licence for Church marriages has been relatively diminishing ever since 1856–60, when 155 in every 1000 marriages were by licence, the proportion in 1871 being 117 in 1000. Resort to banns has correspondingly become popular, they having increased from 785 in 1856–60 to 843 in 1871 out of every 1000 Church marriages.*

---

* "The unsuitableness of banns to the present state of society is commented upon by "the Marriage Laws Commissioners in their Report (1868). They say that in populous "places it seems universally agreed that no really valuable publicity is attained by "banns which afford no safeguard against improvidence, illegality, or fraud, and are "frequently, from their great number, an inconvenient and unseemly interruption to "divine service. Without proposing that banns should be prohibited the Commis-"sioners recommend that the publication should not be required by law as a con-

Certificates of the Superintendent Registrars have been used for the last 20 years in a proportion which has varied little from about 3 per cent. of all the Established Church marriages. In 1851–5 Roman Catholic marriages constituted 30 per cent. of all the marriages outside the Established Church pale; in succeeding quinquenniums the proportion has fallen steadily to 25, 22, and 18·7, while in 1871 it was further reduced to 16·8 per cent.; the corresponding proportions of marriages in the registered buildings of other Christian denominations have in the same periods been 39, 39, 40, 41·6, and 41·8, per cent. One fourth of all the marriages registered in 1871 in Devonshire, Durham, Cumberland, and Wales, took place in the Superintendent Registrars' offices; in Cornwall, Northumberland, and Monmouthshire the proportion was one-fifth.

First Marriages; Re-marriages.—Of the 190,112 couples married during the year 155,346 comprised bachelors and spinsters, 8423 bachelors and widows, 16,371 widowers and spinsters, and 9972 widowers and widows. The proportion remarrying was of widowers to every 100 men married 13·9, and of widows to every 100 women married 9·7. First marriages on both sides constituted 82 per cent. of the whole, first marriages only on one side 13 per cent, and re-marriages on both sides 5 per cent.

Fifty marriages took place during 1871 in which one of the parties was stated to have been previously divorced; in 23 of these cases divorced men married spinsters, in one a divorced man married a widow, in 19 divorced women married bachelors, and in 7 divorced women married widowers. No marriage in which both parties had been previously divorced was registered. Altogether during the eleven years 1861–1871 the number of marriages of divorced persons was 356; the lowest return for any of the years was 10 in 1861, the highest 48 in 1865, 47 in 1869, and 50 in 1871. Divorced men re-marry in greater proportion than divorced women, the ratio being about 5 to 4.

Ages at Marriage.—The marriage registers ought in all cases to show the precise age of the parties married, but in 55,098 out of the 190,112 marriages registered in 1871 the age column was filled in with the words "of full age," "minor," or "under age." By law the clergy are required to register marriages according to the form of the Schedule annexed to the Act (6 & 7 W. 4. c. 86), in which form the example given instead of stating the precise age of one or both of the parties describes the man as "of full age" and the woman as "minor" only. And in the earlier years of registration the clergy were perhaps not unnaturally disposed to content themselves with a bare conformation to the letter of the law without regard to the requirements of statistical and legal investigation which needed a more liberal interpretation of the spirit of that law to satisfy. It is gratifying, however, to find that whereas in 1851 the proportion

---

"dition either of the lawfulness or of the regularity of marriage, being of opinion that "'every useful purpose which can be answered by the publication of banns in the "'Established Church may be equally answered by the mere fact of notice to the "'officiating minister.' That banns afford the greatest facilities for clandestine and "illegal marriages is generally admitted. In large Parishes it is impossible for the "clergyman to make personal inquiries respecting persons who may take up a temporary "or nominal residence for the purpose of having the banns published in the Parish "Church. Hence persons who desire to contract an illegal marriage have only to "choose one of the populous parishes of our large towns, where they readily escape "notice. Any inquiries that are made in such parishes are inevitably left to the parish "clerk whose interest it is not to be too particular in verifying the statements made by "the parties. A declaration similar to that required for marriages before a registrar, "with the penalties of perjury for falsely declaring, would provide some check against "the contraction of illegal marriages."—"*The Marriage Law of England*," by James "T. Hammick, Esq., Barrister-at-Law (pp. 80–81).

of cases in which the precise ages of the parties married were not stated amounted to 63 per cent. of the total marriages registered, ten years later it had fallen to 37 per cent., in 1867–70 to 32 per cent., and in 1871 to 29 per cent. Instances of unwillingness on the part of bride or bridegroom to divulge their ages must of course be anticipated, but it may be hoped that gradually they will cease to occur as common sense gets the better of a vain wish to hide that which is already probably no secret to the clergyman or registration officer, whose avocations, moreover, would most likely predispose them to regard all such matters of detail from a general point of view rather than as affecting any particular individual. Furthermore, if clergymen and registrars made it a rule to put the question as to age in the form "What was your age last birthday?" instead of "Are you of full age?" the marriage returns would soon exhibit a diminution in the number of cases of unspecified age. The importance of complete statistics of the age at marriage in determining the relative fecundity of populations is obvious.

The tables at pp. 26–8 show the extent to which men and women of proportionate or disproportionate ages married in 1871. "Crabbed age and youth," undeterred by social sarcasm or censure, are found every year mating with one another, and examples are met with in these tables of widowers of 60 and 70 years marrying maidens of 15 and 19; a bachelor of 75 wedding a spinster of 21, and a bachelor of 21 marrying a spinster of 70. At the advanced age of 70 years and upwards 238 men and 32 women entered or re-entered into the matrimonial contract. The mean age at marriage or re-marriage in 1871 was for all the men married 27·9 years and for the women 25·7 years; taking only first marriages the mean age of the bachelors was 25·8 and of spinsters 24·4 years; the mean age of the widowers who re-married was 42·6 and of widows 39·0 years. No perceptible variation has taken place in these numbers during the last five years, notwithstanding the proportion of minors has increased from 6·87 men and 20·17 women married under 21 years of age to every 100 marriages in 1867 to 7·86 and 21·99 in 1871. Marriages of minors bear nearly twice as large a proportion to the total marriages now as they did in 1841.

In my next Report, with the Census returns of conjugal condition and age before me, I shall be able to discuss the question of the tendency to later or earlier marriage among the population much more satisfactorily than on the present occasion when those returns are not available. The relative number of early marriages varies greatly in different parts of the country; in 1871 men under age constituted 3·9 per cent. of all the men married in London, whereas in the county of Bedford the proportion was 14·3 per cent.; of women married the smallest proportion under age was 12·5 per cent. in North Wales, the largest 33·6 per cent. in Durham. Some counties are remarkable for maintaining a high proportion of early marriages; for example, Bedford, Leicester, Nottingham, Stafford, and Northampton as regards males, and Durham, Stafford, the West Riding, and Huntingdon in respect of females have for three years successively exhibited the highest proportions of marriages under age.

Signature of marriage registers.—The simplest form of writing, that which everybody who masters the art of shaping letters endeavours first to accomplish, is the individual signature; and as numbers of persons succeed in this without making farther progress, it follows that the proportion of signatures to marks in the marriage registers as an educational test conveys too favourable an impression of the actual condition of the population. When it is found, therefore, that 194 out of every 1000 men, and 268 out of every 1000 women married in 1871 avowed inability to sign their names in the marriage registers, it may be taken for granted

that those who *could* have written their names, but preferred to make a mark only, were not more numerous than those whose caligraphic power was limited to their signature.

Aware that the inferences as to educational condition deduced from the marriage returns are subject to limitation, I have nevertheless from my earliest Reports down to the latest not hesitated to put them forward as conveying an approximate idea of the degree of ignorance prevailing among the lower classes. In my Thirty-first Annual Report (pp. xxxvi—xliv) will be found brought together in one view extracts from previous Reports bearing upon this subject; and it will probably be conceded, that in thus repeatedly calling public attention to such evidence of defective education, this Department has incidentally helped to strengthen a movement certainly not within the original design of the Registration Act, but of immense national importance, namely, that in favour of State education for the poor. The Legislature has now decreed that every child in the country shall be brought under educational influences, and the effect of this wise provision should ultimately be seen in the decline of the proportion of marks in the marriage registers, until all the marriageable people of the pre-educational period have given place to generations of men and women capable not merely of writing their names, but instructed in other essential branches of knowledge, the possession of which can hardly fail to raise the national standard of morality as well as of intelligence.

As the year 1872 will form a new point of departure in educational matters, it may be useful to show here the extent of the improvement which has taken place as regards the substitution of signatures for marks in the marriage registers between 1841 and 1871.

Years.	To 100 Marriages the Mean Annual Proportion of Cases in which a Mark instead of a Name was written in the Register.	
	Men.	Women.
1841–45 - -	32·6	48·9
1846–50 - -	31·4	46·2
1851–55 - -	30·2	43·5
1856–60 - -	27·1	38·1
1861–65 - -	23·6	32·9
1866–70 - -	20·5	28·3
1871 - -	19·4	26·8

In Table 5 (p. xliii) it will be seen that the smallest proportion of men married in 1871 who could not write was in London, Westmorland, Rutland, and the extra-metropolitan parts of Surrey and Middlesex; of women in Rutland, Middlesex, and Surrey (extra-metropolitan), Sussex, and Westmorland.

And the best proof that the marriage returns do yield approximately reliable evidence of educational deficiencies is the fact, that year after year the same localities preserve a uniform character whether of high or low proportions of signatures. If the question of signature or mark were one of timidity, or of mere caprice with the men and women who marry, it is inconceivable that whole counties should maintain for years the same position relatively to one another as they are found to do.

Thus taking the three equi-distant periods 1851, 1861, and 1871, and noting the ten counties which in each year show the highest proportion of marks as distinguished from signatures, the following results are obtained, separately for men and women married:—

MEN.

1851.	Per cent.	1861.	Per cent.	1871.	Per cent.
Herts	50·0	Monmouth	40·2	Stafford	35·2
Monmouth	48·8	Herts	38·1	Monmouth	34·6
Beds	47·8	Suffolk	37·7	South Wales	29·9
Stafford	44·8	Beds	37·6	Beds	29·6
Essex	44·3	North Wales	37·2	North Wales	29·4
South Wales	44·0	Stafford	37·1	Herts	29·1
North Wales	43·8	Essex	36·1	Suffolk	28·5
Suffolk	43·2	Norfolk	35·7	Norfolk	27·6
Bucks	42·8	South Wales	34·9	Salop	26·6
Norfolk	42·1	Salop	34·7	Cambridge	26·4

WOMEN.

South Wales	66·6	South Wales	55·5	South Wales	46·3
North Wales	66·3	Lancashire	51·7	Stafford	44·3
Lancashire	63·2	North Wales	51·5	Monmouth	40·3
Monmouth	61·1	Monmouth	48·9	Lancashire	38·4
Stafford	60·4	Stafford	48·8	North Wales	38·4
Beds	59·1	Beds	46·1	Durham	35·7
West Riding	59·1	West Riding	44·2	West Riding	35·0
Cheshire	55·4	Cheshire	42·4	Beds	33·4
Cornwall	51·9	Cornwall	41·7	Cheshire	31·7
Herts	51·2	Durham	40·3	Notts	31·2

Eight out of the ten counties in the above two groups (for men and women) are the same in each of the three years, thus showing conclusively that it is not merely an accidental circumstance that so many husbands and wives in those counties do not write their names in their marriage registers; while the fact that in every one of the counties the proportion of marks has steadily diminished points irresistibly to the conclusion that backwardness of education is the only sufficient explanation of the position in which these counties stand relatively to the rest of the country, and that a gradual advance in education will alone account for the diminished proportion of marks in different years in the same county.

Buildings registered for marriages.—There were 215 buildings registered in 1871 for the solemnization of marriages; of these 8 were Presbyterians, 33 Independent, 26 Baptist, 18 Roman Catholic, 7 Unitarian, 54 Wesleyan Methodist Original Connexion, 5 Wesleyan Methodist New Connexion, 23 Primitive Methodist, 2 Bible Christian, 13 Other Wesleyan, 12 Calvinistic Methodist, 3 New Jerusalem Church, 3 Catholic and Apostolic Church, and 8 other places of worship. The total number of such buildings on the register on 31st December 1871 was 6640. The distribution of these buildings under the various denominations, throughout the counties, will be found on reference to Table 8 (p. lxvii).

Certified places of worship.—It is no longer indispensable that places of meeting for religious worship should be certified to this Department, but the process is attended with so trifling an expense (the fee being only 2*s.* 6*d.*), while the advantages of certification are by no means insignificant, that probably there are very few which do not come under official cognizance. Thus every certified place of worship is wholly freed and exempted from the operation of the "Charitable Trusts Act, 1853;" it is exempt from levy of rates and taxes, unless "beneficially occupied" by any person; its congregation is placed under the protection of the law against disturbance of its services or injury to the fabric. Furthermore certification is essential as a preliminary to the registration of any place of worship (the churches and chapels of the Establishment always excepted) for the solemnization of marriage.

The number of places which having been so certified were on the register on the 31st December 1871 was 18,528, and the following is a

list of the various designations adopted by the denominations for the purpose of registry. Obviously some of the *115* distinctions shown in this list can hardly be taken to indicate difference of denomination; for example "New Church," "New Jerusalem Church," and "Swedenborgians" represent in reality but one sect or creed, namely, that of which Swedenborg was the founder. Some of the denominations represent only a single congregation. The names printed in italics have been added since the last publication of the list in the 29th Report.

Births.

The number of children born alive and registered during the year 1871 was 797,428, or 4,641 more than in the year preceding, and 101,022 more than were registered in 1861.

The growth of the population is so steady that the comparison of one year's registration returns with those of its immediate predecessor conveys a much less striking impression of progress than a retrospect of 10 or 20 years. In the 10 years 1851–60 the average annual birth-rate to every 1000 persons living was 34·2; in the 10 years 1861–70 the rate increased to 35·2; in 1871 it was 35·0. All the counties of the Second, Third, Fourth, and Fifth Divisions, as a rule, produce less than the average proportion of births; they did so in 1871. London generally approximates nearly to the average, but in 1871 its birth-rate (34·5) was below that of any year since 1862; it was over 36 per 1000 in 1867 and 1868, and was stationary at 35·4 in 1869 and 1870; the marriage-rate was unusually low in London in 1869 and 1870, and although it was raised in 1871 it was then much below the rates for 1864–67. Among the counties of lowest birth-rate, Herefordshire almost always stands out prominently; while Durham, Staffordshire, the West Riding, and Lancashire, are examples of a uniformly high birth-rate. The number of married women of the childbearing ages will no doubt be found to vary considerably in the cases of extreme differences of birth-rate.

Sex.—The birth registers have established the fact that more boys than girls are born, the proportion over a series of years being in round numbers 104 boys to 100 girls. Sometimes, but only twice within the last 20 years, the ratio becomes 105 to 100, while on two occasions (1871 and 1868) it has fallen below 104 to 100. Disregarding particular years, to avoid the interference of exceptional circumstances, it is found that on an average of ten years (1861–70) Cornwall, North Wales, Northumberland, Cumberland, Rutland, and Northampton have the largest proportion of male births; Hertford and Huntingdon counties the smallest. As between legitimate and illegitimate births the latter are proportionally the more productive of male children.

Children born out of wedlock.—Illegitimate births to the number of 44,775 were registered in 1871, amounting to 5·6 per cent. of the total births registered. Twenty years ago they were close upon 7 per cent. of the total births; in the 10 years 1851–60 they averaged 6·5 per cent.; in the following 10 years 6·1 per cent.; so that from whatever cause there has been a gradual and uninterrupted falling off in these evidences of human frailty. I have no grounds for supposing that the general diminution in the illegitimate birth-rate is caused by any increase in the omissions to register; on the contrary, I think that as in those elements of registration which we have the means of accurately observing, undoubted progress in the direction of greater completeness has taken place, it is fair to assume with respect to the registration of illegitimate births that at any rate no more of them are lost sight of now than in former years. In London little or no variation in the rate of illegitimate birth has taken place in 20 years; it amounts to about 4 per cent. of all the births, which is markedly less than the average for the whole country, partly for reasons, no doubt, which will be sufficiently obvious to all who are familiar with life in great cities, but which do not lie within my province to discuss.

The lowest proportions of illegitimate births registered in 1871 were 3·8 and 3·9 per cent. in the extra-metropolitan parts of Middlesex and Surrey; the highest 9·7, 9·4, 9·2, and 9·1 respectively in the counties of Cumberland, Norfolk, Westmorland, and Salop. In a series of years 1852 to 1871 the average annual ratio of illegitimacy is found to be low in Middlesex, Surrey, and Kent, both intra and extra-metropolitan, as well as in the counties of Hants, Gloucester, Warwick, Durham, and Monmouth; the counties of highest rates are Bedford, Suffolk, Norfolk, Hereford, Salop, Leicester, Lincoln, Nottingham, East and North Ridings of York, Cumberland, Westmorland, and North Wales. It will be seen from the following statement that in most of the counties where illegitimacy abounds very little, if any, improvement has taken place of late years.

—	Average Annual Per-centage of Illegitimate Births to Total Births.	
	1852–61.	1862–71.
Cumberland - - -	11·0	11·1
Norfolk - - - -	10·5	10·2
Westmorland - - -	9·8	9·9
Salop - - - -	9·7	9·4
North Riding - - -	8·8	9·0
Nottingham - - -	9·0	8·5
Hereford - - - -	9·5	8·2
North Wales - - -	7·8	8·0
Lincoln - - - -	7·9	8·0
Bedford - - - -	7·8	7·8
East Riding - - -	7·6	7·5
Northumberland - -	7·6	7·3

Seasons.—The birth-rate is usually highest in the first three months, or the winter (March) quarter of the year; taking the mean of each of the quarterly rates during 34 years, the average annual births to 1000 persons living were 35·4 in the March, 35·1 in the June, 32·5 in the September, and 32·3 in the December quarters. On 10 occasions in the last 30 years the birth-rate in the second quarter was higher than in the first; similarly there were 10 fourth quarters of higher birth-rate than the third.

Deaths.

The number of deaths registered in 1871 was 514,879, or 450 less than were returned in 1870 out of a population which is estimated to have increased by 281,496 in the following year. The excess of births over deaths registered in 1871 was 282,549; with the exception of the years 1867 and 1868, the greatest balance on the side of growth ever recorded in any year since registration was instituted in this country. To every 1000 of the population there were 22·6 deaths in the year, the mortality having been slightly below the rate for 1870, while it was also a little above the average annual rates in 34 years. Such average, represented by the mean of 34 annual rates, was 22·4 per 1000; in 16 years of lowest mortality since 1840 the average annual rate was 21·5, in 14 years of highest mortality 23·4; the year 1871 approached more nearly to the high than to the low average. In the most unhealthy year (1849) of the series there was 1 death to every 40 persons living, in the healthiest year (1856) 1 in 49. Table 2 (p. lxi) shows that the healthy and unhealthy years do not alternate singly but mostly in groups of three or four years; a reason for this appears in the fact that the death-rate is to a great extent governed by the mortality from zymotic diseases and that an epidemic of either of these commonly takes two or more years to run its course. What diseases were prevalent in 1871 and the degree in which they severally influenced the death-rate, will be gathered from the customary analysis by Dr. William Farr, F.R.S., of the causes of death, appended to this Report. (*See* Appendix, pp. 219–224.)

Sex and Age.—The 514,879 deaths registered in 1871 comprised 265,563, or 51·6 per cent. of males, and 249,316, or 48·4 per cent. of females. Males constitute 49 per cent., females 51 per cent. of the living population, and the ratio of males dying to males living in 1871 was 23·9 per 1000, of females dying to females living 21·3. So taking the deaths alone the proportion of males to females dying was as 107 to 100, but having regard to the larger number of females in the population out of which the deaths occurred, the proportion of male to female deaths out of equal numbers of both sexes living was as 112 to 100.

The rate of mortality at all ages among males has somewhat increased of late years, while the female rate has diminished.

Tables 19 and 20 (pp. lxxviii–ix) show the ages at which the deaths in every year from 1838 to 1871 inclusive have occurred, and subsequent Tables (21–24) show the proportion which those deaths bore to the living at the several ages calculated upon the basis of the Census returns of 1841, 1851, 1861, and 1871. I have already remarked* upon the extreme importance of these data, which will increase in value as they continue to accumulate. No other great country, as far as I am aware, except Sweden, possesses so comprehensive and trustworthy a guide for the determination of those questions of public health and provident finance in which the duration of human life is a fundamental element.

The ages of the population at the Census of 1871 having now been ascertained, the rate of mortality of the two sexes at different ages in 1871 and in each of the years back to 1861 is given in the Tables. As before stated, of males in 1871 the deaths at all ages were at the rate of

* See pp. v and vi.

23·9 per 1000 living; of females 21·3. In the first five years of life the male rate was 71·7, the female 62·4; at ages 5 and under 10 years 8·3 and 7·5; at 10–15 the rates are at their lowest, 4·4 for males, 4·5 for females; at 15–25 both sexes experienced a nearly equal mortality, 7·7 and 7·4; thenceforward both male and female rates increase to the end of life, the male being invariably highest, as at 25–35 male 11·1, female 9·7; at 35–45 male 14·4, female 12·3, and so on.

Comparison of the mortality in 1871 with the average annual rate in 1861–70 shows for males a diminution of nearly 2 per 1000 in the rate of deaths at ages 0–5, an increase of about 1 per 1000 at ages 25–65, and a decrease at the more advanced ages; the female rate in 1871 at ages 0–5 was 1·4 per 1000 below the ten years' average, at ages 5–55 there was no difference worthy of note, at 55–65 there was an increase, and at 75–95 a decrease. The rates at the extreme ages of 95 years and upwards fluctuate greatly in consequence of the relatively small number of cases coming under observation.

The interest which attaches to cases of reputed centenarianism has induced me to bring together into one view the particulars of such cases as were recorded in the death registers of 1871, and these will be found in Table 18 (p. lxxvii) localized so as to admit of their being easily traced by any one who may be desirous of making inquiry respecting them. From time to time I have to announce in my Weekly, Quarterly, and Annual Reports the deaths of persons whose ages *as stated in the registers* amount to or exceed 100 years. It will not be deemed superfluous by those who take note of the newspaper correspondence which so frequently follows the announcement of a case of extreme longevity, for me to remind the public that the district registrars have no authority, even if they had the means and the leisure for so doing, to investigate the truth or otherwise of the statements as to age made by the legal informants of deaths; the informants are alone responsible for the correctness of those statements. As a most able and pains-taking writer upon this subject in his recent work remarks: "The Registrar General has no alternative but to tell the tale as it is told to him."* In 1871 the deaths of 69 persons were registered at the following ages, *as stated by the informants;* 27 at 100, 17 at 101, 10 at 102, 5 at 103, 3 at 104, 2 at 105, 2 at 106, 1 at 107, 1 at 108, and 1 at 109 years. Of these reputed centenarians 25 were males and 44 females. From 1861 to 1871 inclusive the registered deaths at 100 years of age and upwards have amounted to 856, namely, 231 males, and 625 females; so that on an average 21 men and 57 women go to their graves every year with the renown of centenarianism attaching to their memories. And the Census returns show that about 180 persons out of the entire population would, on enumeration, return themselves as having attained their hundreth year of life; the annual rate of mortality at this advanced stage would therefore be about 43 per cent. By the English Life Table the mortality at the ages 100 and upwards would be 58 per cent., and that implies 116 deaths annually out of 200 living. There is evidence † that it would be unsafe to attempt to draw any precise conclusion as to the limit of the duration of human life from the unverified statements of individuals in the death registers; all that may be said with certainty is that instances such as that of Jacob William Luning whose death in 1870 at the age of 103 years was clearly established by documentary evidence submitted to me and published in my Weekly Return, show that the limit of life is not absolute at 100 years, however exceptional may be the cases in which it is exceeded.

---

* "Human Longevity," by W. J. Thoms, F.S.A.

† Mr. Thoms gives examples of 30 cases investigated by him: 4 only of these turned out to be demonstrably centenarians; 4 were doubtful; 22 are either disproved absolutely or are shown to be unsupported by proof.

It is worthy of note that the experience of Life Assurance Societies in this country supplies only one example of an insured life completing its hundreth year, namely that of Jacob William Luning above referred to. The difficulties attending an investigation of cases of reputed centenarianism are no doubt considerable, but the question is one of scientific importance and I shall at all times be glad to receive any really valid corroborative proof of such extreme longevity.

Seasons.—Over the years 1838 to 1871 inclusive the quarterly distribution of the deaths has been such as to yield an average annual rate of 25·0 per 1000 in the first, 22·1 in the second, 20·7 in the third, and 21·9 in the fourth quarter. In 1871 the rate was below the average in the March and June quarters, and above in the September and December quarters. Departures from the rule of the first (or winter) quarter being that of highest mortality have occurred only three times, namely in 1846, in 1849, and in 1868 : the third (or summer) quarter has exhibited the lowest death-rate in every year save 1846, 1849, 1854, 1868, and 1870. Detailed information respecting the meteorology and evidences of the registration returns in the four quarters of 1871 is contained in the "Summary of the Quarterly Reports" given in subsequent pages (xxviii–xlviii).

Locality.—An average annual death-rate of 22·6 per 1000 for the whole of England and Wales is the expression of a mean of rates differing widely, the range being greater or less according as the units of comparison are large and comprehensive like the Registration Divisions, or are selected for special representative purposes such as urban and rural, densely and sparsely populated, healthy and unhealthy places. Thus, the group of South Eastern Counties forming the Second Registration Division experienced in 1871 an average mortality of 18·8 per 1000, while in the Eighth Division which comprises Cheshire and Lancashire the rate was 26·7. In four of the Divisions with an aggregate population in 1871 of 10,453,107 the mortality was above the average rate (22·6) for all England ; below in the remaining seven Divisions containing 12,259,159 persons. The mortality in these great sections of the Country remains tolerably constant on an average of years, the relative position of each Division in the scale of high or low mortality being for the most part determined by the degree in which the component populations are aggregated in large towns or dispersed over agricultural districts. In ten out of the eleven Divisions the mortality in 1871 differed to no appreciable extent from the average of preceding years ; but in the Tenth Division there was a large increase, which is found to have occurred in the two counties of Durham and Northumberland and to have been mainly due to a severe epidemic of small-pox.

The Counties as units of comparison give a range of mortality in 1871 from 17·3 and 17·8 in the extra-metropolitan parts of Surrey and Kent, to 27·5 in Lancashire and 28·5 in Durham. Sixteen Counties have an average annual death-rate below 20 per 1000.

A more useful, because a more specific comparison than either of the foregoing, is that between populations living under well defined and opposite conditions, such as is obtained by contrasting the Urban with the Rural parts of the country. Nearly thirteen millions of people are comprised within districts or sub-districts wherein the chief towns are situate, and the death-rate among these in 1871 was 25·0 per 1000, or slightly in excess of the annual average ; amongst the residue of nearly ten millions inhabiting the smaller towns or scattered over the purely rural districts the rate was 19·5, or slightly below the average. For general purposes this comparison may be taken as giving a fair idea of the relative advantage as regards the duration of life which a residence in the country confers over one in towns ; bearing in mind, of course, that there are

special causes of unhealthiness in some country places and that the towns themselves have a wide range of death-rate.

In the "Summary of the Quarterly Reports," subsequently given (pp. xxviii–lxviii) will be found detailed remarks upon the sanitary condition of different localities as indicated by their death-rate in each quarter of 1871, together with such conclusions relative to the marriages and births as seemed to be deducible from the observed facts. And with regard to the large cities and towns, of which a selection of seventeen has been made, with London at their head, I have nothing now to add to the comments wherewith I prefaced my Annual Summary of the Weekly Returns for 1871, and which are hereto appended (pp. xlviii–lv).

Deaths in Public Institutions.—Within 707 workhouses, 346 hospitals, and 82 lunatic asylums, there were altogether 46,556 deaths registered in 1871, or 9 per cent. of the entire number of deaths which occurred in all England; the corresponding proportion in 1870 was 8·3 per cent., but the number of institutions brought into account for that year was less by 101 than is comprehended in the return for 1871. This difference arises in great measure from the fact that in the latter year the prevalence of small-pox led to the establishment of many hospitals for the reception of patients suffering from that disease; furthermore the cottage hospital system is being gradually extended, and the increasing attention paid to sanitary matters by local authorities has led generally to more adequate hospital accommodation being provided.

As explained in an introductory note (p. 99) the Table of deaths registered in the principal public institutions situate within the several districts and sub-districts (pp. 100–117) will afford the means of correcting the death-rates and so will be invaluable for purposes of local inquiry. Obviously, there is great disparity in the facilities possessed by the populations of different parts of the country of access to institutions for the relief of their necessities. In London 17·9 per cent. of all the deaths registered in 1871 took place in workhouses, hospitals, or lunatic asylums, in the South Eastern Counties the proportion was 11·2 per cent., in the South Midland 9·3, in the Eastern 7·3, in the South Western 6·6, in the West Midland 7·6, in the North Midland 5·6, in the North Western 9·1, in Yorkshire 5·4, in the Northern Counties 5·7, and in Monmouthshire and Wales 3·5.

Progress of Registration.

Names on the Registers.—The records of this Office for the period of 34½ years, extending from the middle of 1837 to the end of 1871, comprehend in respect of their relation to the three great events of life—birth, marriage, and death—upwards of *forty-seven million* NAMES; each name being inscribed in an Alphabetical Index prepared quarter by quarter promptly as the certified copies reach this Office, and so arranged as to give the utmost facility for reference. All that is necessary on the part of an inquirer to ensure the immediate production of an entry of marriage, birth, or death, is that he should give the year in which the event took place and the correct name of the person to whom it relates. Of course in proportion as these two particulars are accurately given will the search for the entry be facilitated. Prior to 1866 these Indexes were prepared by hand-copying on parchment sheets, which were bound up into unavoidably bulky volumes, of which between 70 and 80 were produced yearly; so that by the end of 1865 they amounted altogether to 1741 volumes. The rapidly increasing demands for space which these huge books were thus making, and the limited means at disposal for bestowing them, led to a recommendation from me in 1866 to Her Majesty's Government that in future these Indexes should be printed; this was adopted, and I am gratified to be able to report that after

several years' experience it is found to work admirably, as well on the side of greatly increased comfort to the public in making use of them as on that of departmental convenience. The saving in bulk alone may be estimated from the fact that the space occupied by 50 names in the manuscript Index now takes 500 names in print. To this advantage may be added the not inconsiderable one which print always has over the best manuscript for reference purposes, the diminished liability to errors in copying, and, greatest of all, that the existence of such invaluable documents no longer depends on the absolute preservation of one single copy. I am but doing an act of simple justice in bearing testimony to the admirable manner in which the responsible work of printing the Indexes is executed by Messrs. Eyre and Spottiswoode, Her Majesty's printers. The regularity and promptitude exhibited by them from first to last is in my opinion beyond praise.

With such important records in my custody I need hardly say that the utmost possible precautions are taken against mischance by fire or otherwise; but experience teaches that "the unexpected happens" to a very large extent in human affairs, and I may venture to refer to what must under present circumstances always be a source of anxiety to anyone holding the post which I have had the honour for 31 years of filling. I allude to the fact that of the Alphabetical Indexes for 28½ years (1837 to 1865) only one copy exists, and that, consequently, if any accident were to befall that copy, reference to the registers for all those years would virtually be suspended until, after a great lapse of time and at an enormous cost, fresh Indexes were prepared. From 1866 that contingency is at any rate provided against, for of the printed Indexes six copies are now produced at little more than the former cost of the one manuscript copy. It appears to me that it is worthy of consideration by Her Majesty's Government whether it would not be advisable at some future time to make provision for printing the Alphabetical Indexes to the Records of this Office for the years 1837 to 1865 inclusive; primarily on the precautionary grounds above suggested, and additionally because such a step would be gratefully appreciated by the public who, as will subsequently be seen, are every year applying more numerously for certificates. It would also have this further advantage, that it would the better enable me to meet the demands upon the search-room staff of this Office to which its increasing business gives rise.

Registers and Records.—In addition to the ordinary Registers of Marriages, Births, and Deaths, certain other Registers and Records have at various times been deposited in this Office, and are now exhibited to the public on payment of the statutory fees, namely, *one* shilling for the search or reference, and two shillings and sixpence for the certified copy of an entry. The following is a list of all the Registers and Records now in my custody:—

1. Registers of Births registered in England and Wales on and after 1st July 1837.
2. Registers of Deaths registered in England and Wales on and after 1st July 1837.
3. Registers of Marriages registered in England and Wales on and after 1st July 1837, after solemnization in Churches of the Established Church, in registered Roman Catholic and Dissenting Places of Worship, and in District Register Offices; also of Quakers and of Jews.
4. Registers of Births and Deaths at Sea registered since 1st July 1837.

[By the Act 6 & 7 Will. 4, c. 86, sec. 38, *every Certificate sealed or stamped with the seal of the General Register Office is to be received as evidence of the Birth, Death, or Marriage to which the same relates without any further or other proof of the Entry.*

The General Indexes of Births, Deaths, and Marriages are completed about nine to twelve months after the date of the Registration, but Searches may be made in the Registers not indexed if the *locality and date* can be accurately stated by the Applicant.]

5. Non-Parochial Registers of Baptisms or Births, Burials or Deaths, and (in a few instances) of Marriages, being the Registers or Records kept by various bodies and congregations of Nonconformists prior to the general system of registration commenced in 1837 ;—comprising amongst others the Registers kept at *Dr. Williams's Library* from 1742 ; *Bunhill Fields Burial Ground* from 1713 ; the registers of *French Protestant and other Foreign Churches* in England ; the registers, &c. of the *Society of Friends*, &c.

   [By the Acts 3 & 4 Vict. c. 92, & 21 Vict. c. 25, *Extracts from these Registers stamped with the seal of the General Register Office are receivable in evidence in all civil cases.* For Searches the description of Register and the locality or name of the Chapel should be given.]

6. Fleet and May Fair Registers of Marriages.

7. Registers of Marriages of British Subjects in Foreign Countries, pursuant to the Act 12 & 13 Vict. c. 68. [The Marriages under this Act are those solemnized since July 1849, at British Consulates abroad.]

8. Registers of Births, Deaths, &c. of British Subjects in Foreign Countries. [These are Registers kept by the British Consuls and other authorities abroad.]

9. Registers of Marriages in India, pursuant to 14 & 15 Vict. c. 40. [The Marriages under this Act are those solemnized since 1st January 1852, in the presence of Registrars in India. The Marriages by Clergymen of the Church of England are not included.]

10. Registers of Baptisms, Marriages, and Burials kept by Army Chaplains at the Military Stations abroad, from 1801 to 1870.

11. Returns of Places of Worship certified to Diocesan Registrars, Clerks of the Peace, &c., prior to 1st July 1852 (19 & 20 Vict. c. 119. s. 24.)

12. Register of Buildings certified to the Registrar General as Places of Religious Worship since 1st July 1852 (18 & 19 Vict. c. 81.)

Searches and Certificates.—The total number of searches (including those relating to the non-parochial and other records) made by the public in this Office during the year 1871 was 17,910, the number of certificates granted was 14,418, and the fees received for the same and paid into Her Majesty's Exchequer amounted to 2,705*l.* 7*s.* In the previous year the corresponding number of searches was 16,170, and of certificates granted 13,127, the fees amounting to 2,456*l.* 19*s.* 6*d.* The non-parochial and other miscellaneous searches form a very small proportion of the whole. Exclusive of these, the searches for entries in the ordinary registers of marriages, births, and deaths have increased in successive periods of five years since 1845 in the following manner :—

Years.	Number of Searches.
1845–9	4,758
1850–4	8,344
1855–9	17,425
1860–4	35,127
1865–9	56,544

The fees for searches and certificates of all kinds, which amounted to 1,721*l.* 4*s.* 6*d.* in the five years 1845–9, had risen to 9,534*l.* 2*s.* 6*d.* in 1865–9. For purposes connected with the Factory Acts numerous searches for registers of births are made and certificates given, free of charge ; these are not included in the numbers of searches above mentioned.

The introduction of the competitive system of appointment to clerkships in the Civil Service has no doubt led to part of the recent increase in the applications for birth certificates at this Office, such proof of age being an indispensable condition of candidature. And there is every probability that as years advance, as the registers become more complete and perfect, and as their value becomes more widely known, the public will resort to this Office to a larger extent ; its internal organization therefore will need to be preserved in the future, as it has been hitherto kept, in such an elastic condition that it may be capable of expansion from time to time as the exigencies of the case may require. The addition of more than *one million and a half* of new names to the registers every year implies of necessity an increase of work in all the branches of this Department,

United Kingdom.

The population of the United Kingdom as enumerated at the Census of 1871 amounted to 31,483,700 persons, of whom there were in England and Wales 22,712,266, in Scotland 3,360,018, and in Ireland 5,411,416. Relatively to the area, the proportion of population in each of the three divisions of the kingdom was in 1871 as follows:—England and Wales has 100 persons to every 164 acres; Scotland 100 persons to 580 acres; Ireland 100 persons to 385 acres. The growth of the English population between 1861 and 1871 was at the rate of 13·19 per cent., of Scotland 9·72 per cent.; whereas in Ireland there was a decrease to the extent of 6·68 per cent.

Emigration went on steadily during the ten years, but at a slower rate than in the previous decennium; thus, between 1851 and 1861 the number of British-born emigrants reported to the Emigration Commissioners was 2,054,578, while between 1861 and 1871 only 1,674,594 were so reported, showing a decrease of 379,984 in the latter period. The relation between the excess of births over deaths (or the natural increase), the emigration, and the population enumerated at the Census, is thus exhibited for the United Kingdom:—

Registered births, 1861–70 - - -	10,083,719*
Registered deaths, 1861–70 - - -	6,414,556*
Excess of births over deaths, 1861–70 - -	3,669,163
Emigration, 1861–70 - - -	1,674,594
Excess of births *less* emigration, 1861–70 -	1,994,569
Enumerated population, 1861 - -	28,927,485
Estimated population, 1871 - - - [Obtained by adding the difference between the excess of births and the emigration to population in 1861.]	30,922,054
Enumerated population, 1871 - - -	31,483,700
Difference between enumeration and estimate for 1871 - - - -	561,646

This implies that there was a certain amount of immigration, and that the birth registers of the United Kingdom are defective. If the deaths and the emigrants are all registered, 56,165 annual births or immigrants are required to make up the number of the population enumerated in 1871.

In 1871 the emigrants of declared British origin numbered 192,751, as compared with 202,511 in the year preceding. There has been an increase of late years in the emigration to the North American Colonies and the United States, while the proportion going to the Australian Colonies and New Zealand has diminished. The sex, destination, and occupation of the emigrants in 1871 will be found stated in Tables 46 and 47 (pp. cii–ciii).

In 1871 the Scotch marriage-rate was 14·2 per 1000, the birth-rate 34·5, and the death-rate 22·2; the marriage-rate was nearly 2·5 per 1000 below that of England, the birth-rates were almost identical, and there was a difference only of ·4 per 1000 in the death-rate in favour of Scotland.

The registered rates of persons married, of birth, and of death in Ireland in 1871 were 10·7, 28·1, and 16·5 per 1000 respectively; these rates differ so widely from those of England and Scotland, as to show

* In order to make up the totals of births and deaths in the ten years for the United Kingdom it has been assumed that the birth and death rates in Ireland were the same during the earlier years of the decade previously to the passing of the Registration Act for that part of the kingdom as during the later years.

either that registration in Ireland is extremely defective, or that the constitution or the circumstances of the population is altogether different from that of Great Britain. How far this latter element operates in the production of the discrepant results above noticed will be seen when it is possible to compare the ages of the people and their conjugal condition in the sister kingdoms according to the last Census returns. Meanwhile I follow the course which in past years has been adopted on the authority of the Registrar General of Ireland, of assuming that the actual marriages, births, and deaths bear the same proportion to the population in Ireland as they do in England.

Thus arrived at, there were in the United Kingdom in 1871 to every 1000 persons living, 16·4 persons married, 35·0 births, and 22·6 deaths.

The Army.

By direction of His Royal Highness the Field Marshal Commanding-in-Chief I am favoured annually with returns relating to the Army. In 1871 the strength of the entire British Army abroad as well as at home was 192,665, of whom 105,757 were serving within the United Kingdom, and the remaining 86,908 were distributed in different parts of the world. The deaths occurring in the year out of the above strength were 1005 at home and 1322 abroad, making altogether 2327. Proportionately to each 1000 of strength there were at home 11·9 deaths of officers and 9·4 of non-commissioned officers and men; abroad 11·4 deaths of officers and 15·4 of non-commissioned officers and men. The mean annual mortality of officers in the six years 1866–71 was at the rate of 10·5 deaths per 1000 at home and 12·6 abroad; among non-commissioned officers and men the corresponding rates were 11·2 at home and 18·3 abroad.

Of the Army at home the mortality rate was considerably less among the 1216 officers stationed in Ireland than it was among the 3664 officers stationed in Great Britain; of non-commissioned officers and men, 26,437 were stationed in Ireland, and their mortality rate was 8·5 per 1000 as compared with 9·7 among the 74,440 stationed in Great Britain.

Births and Deaths of British Subjects at Sea.

Marine Register Book.—Under the Registration, the Merchant Shipping, and the Passengers' Acts, an obligation is laid upon all captains or commanding officers of British vessels to transmit to me the particulars of all births and deaths that occur among English subjects at sea, for entry in the Marine Register Book which is kept for that purpose. In 1871 there were 80 births and 204 deaths so recorded, the greater part of which were reported through the Admiralty from Her Majesty's Ships, and having regard to the number of such occurrences which (as stated below) come under the cognizance of the Registrar General of Shipping and Seamen it is obvious that the law in its present form is virtually inoperative throughout the Mercantile Marine. For in the same year that officer had reported to him by the captains or commanding officers of vessels at the termination of their respective voyages in ports of the United Kingdom 208 births and 421 deaths of British subjects at sea, exclusive of soldiers, marines, invalided seamen from the Royal Navy, and seamen on ships' articles. The Bill now before Parliament for amending the Registration Acts contains provisions which if sanctioned by the Legislature will, it may be hoped, ensure a more perfect record than now exists of the births and deaths of English subjects at sea.

Mercantile Marine.—The Registrar General of Shipping and Seamen returns the strength of the Merchant Service in 1871 at 199,738 men and boys, exclusive of Masters; and the deaths occurring in the year out of

that strength at 4338, the rate of mortality being equivalent to 21·7 deaths per 1000 of strength. The death-rate shows a further decline on the very high rates of several preceding years, and was in fact lower than in any year since 1864. But that it is and has been for some years excessive, will be evident from a comparison of the two decenniums 1852–61 and 1862–71; the mean annual mortality was 19·2 in the former as compared with 23·1 in the latter period. As the condition of the Mercantile Marine is just now engaging a good deal of public attention it may be worth while to see how that Service compares in point of mortality with the Naval Service and the general home population at corresponding ages. The mean age of the men afloat in the Merchant Service is about 28 years, while that of the men in Her Majesty's Navy is about 26 years, so that there is really little difference between the two in respect of age. Now the mortality among the English male population at the age 28 is by the English Life Table 9·7 per 1000; in the Navy the average annual rate of mortality in the years 1856–72 was 14 per 1000; in the Merchant Service from 1852–71 it was 21 per 1000. Table 58 (p. cix) gives the ages and causes of death of the Merchant Seamen who died in 1871. Of the total 4338 deaths, 858 occurred under 21 years of age, and in 578 cases the age was "unknown." A like element of uncertainty enters into the account of the distribution of the causes of death, 272 of which were "not specified." The number of deaths by accidental drowning was 976 in 1871 and 989 in 1870, by shipwreck 1500 and 1655, and by "other accidental causes" 279 and 302 respectively. The deaths from all specified causes other than disease in 1871 were 2786, by diseases specified 1280; the 272 deaths from causes unspecified may be assumed to belong to the two classes of deaths from disease and deaths from injury or accident in like proportion to the numbers actually specified in the two classes. A comparison of the relative mortality from the two classes of causes in the Merchant Service and in the Royal Navy is subjoined.

—	Deaths per 1000 of Strength.	
	Royal Navy. — Annual Average, 1856–72.	Merchant Service. — 1871.
From Disease - - - - - -	10·0	6·8
From Injury or Accident (including Drowning)	4·0	14·9
All Causes - - - -	14·0	21·7

Thus it appears that in the Navy about two-thirds of the deaths are the result of disease, while in the Merchant Service two-thirds of the deaths are the result of causes other than disease. Among the home population at the sailors' ages the mortality from all kinds of violence does not exceed 1 per 1000. The dangers of the sea are now in the Navy four times, and in the Merchant Service fifteen times, as great as the dangers on land.

Wills.

It is probably little known that a person coming to this Office to search for the proof of a death having taken place can at the same time learn whether a will has been proved or letters of administration granted for

the disposition of the deceased's estate. By the Act 20 & 21 Vict., c. 77, s. 67, printed Calendars are directed to be made of all Grants of Probate and Administration, with "Notes setting forth the dates of such Grants, " the Registry in which the Grants were made, the names of the Testators " and Intestates, the place and time of death, the names and descriptions " of the Executors and Administrators, and the value of Effects." Under direction of the Court of Probate, in conformity with section 68 of the said Act, a copy of these Calendars is regularly transmitted to this Office, where it "may be inspected by any person on payment of a fee of one " shilling for each search, without reference to the number of Calendars " inspected."

The Calendars date from the year 1858 inclusive, and are alphabetically arranged under the two heads of "Wills" and "Administrations." In my Twenty-second Report I showed that these Calendars contained information capable of being turned to useful account, analysis of the facts for one year (1858) having demonstrated the wide diffusion of the accumulated wealth in personal property of this country, in opposition to the notion that it is confined to any one class.

From the volume of "Judicial Statistics" for the year 1871 it appears by a Return of the Chief Registrar of the Court of Probate that the number of probates and of letters of administration granted in that year at the Principal Registry was 15,299; in the forty District Registries the number was 24,391; making altogether 39,690 probates and administrations. The value of the property under which these probates and administrations were sworn in the Principal and District Registries combined, amounted to 112,178,935*l.*; the average value under each probate, &c. being 2826*l.*, as compared with a corresponding average of 2696*l.*, in 1870, and 2634*l.* in 1869.

Foreign States.

France.—Austria.—Italy.—Spain.—The returns of population, marriages, births, and deaths in 1871 for these countries have not yet reached this Office.

Prussia.—Through the courtesy of Dr. Engel, the Director of the Statistical Department at Berlin, I am now enabled to include Prussia among the European States, of whose vital statistics all my later Reports have contained a *résumé*. The population of Prussia in 1853 was 17,065,143, and it had increased to 19,543,540 in 1866: the addition of Schleswig Holstein, Hanover, Hesse, and Nassau in 1867 raised the population to 23,971,337, which in 1871 had become augmented to 24,643,874. Prior to 1866 the increase was at the rate of 1·1 per cent. annually; since 1867 the annual rate of growth has been but 0·2 per cent.

The marriage-rate ranged from 15 to 18 per 1000 between 1853 and 1865, the birth-rate from 36 to 42, and the death-rate from 26 to 32 per 1000. In 1866 there were cholera and war to contend with, and the marriage-rate fell from 17 and 18 in the three preceding years to 15·5 per 1000; the birth-rate of that year was not affected by the combination of evils, but the death-rate was fully 7 per 1000 in excess. In 1867–9 the marriages, births, and deaths approximated to the normal standard. In 1870 the Franco-German war sent the marriage-rate down to 14·5 per 1000, the effect of which is shown in the extremely low birth-rate of 1871, namely 35 per 1000; the death-rate in 1870 was 28·6 and in 1871 rose to 30 per 1000. Speaking generally, there is no considerable difference between the average annual marriage rates of Prussia and England, but the birth and death rates are very much higher in Prussia than with us.

Amendment of the Registration Acts.

The Bill introduced by Her Majesty's Government in 1872, amending the Acts relating to Civil Registration of Births and Deaths did not become law; but I trust that the measure with the same object in view, under the consideration of Parliament, will this year receive the Royal assent.

In the law at present in force in England and Wales, various improvements may in my opinion be introduced.

I think that the number of qualified "informants" being increased, it should be made compulsory, under a penalty, to effect the registration of every birth and death within a prescribed time after its occurrence.

Also that legally qualified medical practitioners should be required to state for insertion in the Register the cause of death of their deceased patients. When no such written certificate is produced, the Registrar should not record the death unless he be satisfied that it arose from natural causes: and in cases of suspicion or violent deaths he should convey information to the coroner, whose duty it will be to decide whether an inquest is to be held.

Also that a statutory declaration be produced before a registration officer be allowed to correct errors of fact or substance in registers, the present law permitting a practice which I consider too lax in a matter of such importance.

Also that power be given to alter the schedules in the registers, and to change the limits of registration districts when deemed advisable.

With a view to preventing infanticide, I wish new regulations to be enacted as to the burial of stillborn children.

Registration of births and deaths not having been compulsory hitherto in England and Wales, some of these proposed enactments will be proved to be more stringent than the public and registrars have been accustomed to during the last 36 years; but in preparing them for the consideration of the legislature, much consideration has been given to the protection of the public from undue constraint. It has not been forgotten that in England and Wales upwards of 1,300,000 births and deaths occur annually, and that thus a very large number of families will in some measure be affected by this proposed statute; but I know of no milder mode in which *compulsory* registration can be insisted on, which for various reasons Her Majesty's Government have been urged to establish by statute without further loss of time.

I have the honour to be,
Sir,
Your faithful servant,
GEORGE GRAHAM,
Registrar-General.

Summary of the Quarterly Reports, 1871.

First Quarter.—January, February, March.

In the UNITED KINGDOM the births of 280,062 children, and the deaths of 184,659 persons of both sexes, were registered in the three months ending March 31st, 1871. The natural increase of population was thus 95,403.

The number of persons married in the quarter ending March 31st, 1871, was 107,070.

The marriage, birth, and death rates of the Kingdom differ little from those prevailing in England and Wales.

ENGLAND.—The marriages in the winter quarter of 1871 were much below the average numbers. The births were numerous, but stationary. The deaths decreased both in town and country, as compared with the corresponding quarter of the previous year. Scarlet fever declined, and had it not been for a virulent outbreak of small-pox in London and Liverpool the public health would have shown still more decisive marks of improvement.

Marriages.—The marriages of 72,610 persons were recorded in the March quarter of the year. The annual average rate in the three months was 12·9 per 1000 against 13·2 in the corresponding quarter of 1870. The decrease was not great in any particular division of the country, nor was the increase, which was chiefly exhibited in the manufacturing districts, conspicuous.

Births.—The births of 209,523 children born alive were registered in the first quarter of 1871, and the equivalent annual birth-rate was 37·3, or the same as in the corresponding quarter of 1870. The counties exhibiting a decrease on the average of the three previous corresponding quarters were Kent, Sussex, Huntingdon, Rutland, and Lincoln. The Northern group of counties showed the greatest relative increase.

Increase of Population.—The natural increase of the population, that is the excess of births over deaths, was 71,130 in the three months, or at the rate of 790 per day; and if it were not for the disturbing element of migration, the natural increment would suffice for determining the increase of the population at any given period. Emigration is a fluctuating quantity, not only in successive quarters of the same year, but also in corresponding seasons of different years. 27,741 emigrants sailed from British ports during the quarter, being about 5000 less than in the corresponding period of the previous year. 13,449 of the emigrants were of English, 1869 of Scotch, and 8788 of Irish origin, and 3635 were Foreigners. The number of foreign emigrants was, however, only 100 below that of the previous March quarter. The large proportion of Foreigners was probably owing to the disturbed condition of political affairs on the Continent. The United States attracted not less than seven eighths of the whole, the remainder, chiefly of British origin, went to the Australian Colonies.

Prices, Pauperism, and the Weather.—The average price of wheat was 53*s.* 7*d.* per quarter, being higher than it had been since the September quarter of 1868 when it was declining from exceptionally high rates which had ruled during the preceding year. Beef by the carcase averaged 6⅜*d.* per lb. and mutton 6½*d.* per lb. at the Metropolitan Meat Market. In the quarter ending December 1870 the prices were 6⅜*d.* and 6⅝*d.* re-

spectively. Potatoes (York Regents) averaged 87*s.* 6*d.* per ton at the Waterside Market, Southwark, being cheaper by 15*s.* and 17*s.* 6*d.* per ton than in the corresponding quarters of the two previous years.

The average number of paupers relieved on the last day of each week in each of the winter quarters of the three years 1869, 1870, and 1871 was as follows:

	In-door.	Out-door.
Quarter ending 31st March 1869	162,308	850,883
" " 1870	164,552	893,895
" " 1871	160,968	879,574

The extreme depression of temperature which prevailed at the end of the year 1870 continued in January 1871. Although the mean temperature at Greenwich in January was 33°·2 or 3°·1 below the average of 100 years, the high temperature of February and March raised the mean of the whole quarter 1°·6 above the average of the same period. The lowest temperature was observed at Strathfield Turgiss in Hampshire, where in January it sank to 2°·7, and at Bournemouth in the same county a remarkably sudden rise occurred on 5th January from 13°·7 to 39°·4 in about four hours. Rain fell at Greenwich during the quarter to the amount of 4·3 in., being rather more than half an inch under the average of the same season for the past 56 years.

Deaths; and the State of the Public Health.—The 138,393 deaths registered during the first or winter quarter of the year showed a decline of more than 5000 upon those returned in the corresponding three months of 1870, but considerably exceeded the numbers in the same period of the three preceding years. The mortality was at the annual rate of 24·7 per 1000 persons estimated to be living, against 26·0 in the first quarter of 1870, and was ·5 below the average rate in the corresponding quarter of the ten years 1861–70.

In the eleven great registration divisions of England the mortality varied from 21 per 1000 in the Eastern and South-eastern counties, to 27 and 29 per 1000 respectively in London, and the North-western counties comprising Lancashire and Cheshire. The rates in each of the eleven divisions, excepting London, showed, however, a decline from those which prevailed in the first quarter of 1870.

The registrars of the 2197 sub-districts of England and Wales reported 21,551 fatal cases of the seven principal diseases of the zymotic class, against 20,091 in the first quarter of 1870; 6086 were referred to scarlet fever, 4903 to small-pox, 4073 to different forms of fever, 2632 to whooping-cough, and 1,476 to measles. The deaths from scarlet fever showed a considerable decline upon the last quarter of 1870, but were only 600 lower than in the first quarter of that year. The fatal cases of fever whooping-cough, and measles, each showed a considerable decline from the numbers in the corresponding three months of 1870, while those of small-pox showed an excess of nearly 4500, of which further details will be found below.

In the urban population of the country, comprising all the chief towns, the annual death-rate was 27 per 1000, while in the remaining, or rural population, it was only 22. Compared with the number of deaths in the first quarter of 1870, the rate in the quarter under review in the large town districts showed a decline of 1·0 per 1000, while the decrease in the rural districts was 2·0 per 1000. It is evident, therefore, that the town population did not participate to the same extent as the rural districts in the general improvement in the public health The epidemic of small-pox which more or less generally prevailed, and was principally confined to large town districts, is the explanation of this fact.

The mortality in the 20 large cities of the United Kingdom, furnishing weekly returns, averaged 29 per 1000, and was higher than in the cor-

responding quarters of the past three years, the increase being largest in Liverpool where the small-pox epidemic prevailed with the greatest severity; in the 17 English towns the rate averaged 28 per 1000. The mortality was low in Portsmouth and Hull, and compared with recent corresponding quarters showed a considerable reduction in Manchester, Leeds, Sheffield, and Wolverhampton.

In the first quarter of 1870 the mean temperature of January was considerably above the average, while February and March were comparatively speaking cold, the mean temperature of the quarter being 38°·0. In the first quarter of 1871 the weather in January was remarkably severe, February and March were warmer than the average, and the mean of the quarter was 40°·2. This difference between the two winters did not materially affect the proportions of deaths occurring among infants and elderly persons. In the 17 largest English towns, of the total deaths registered in the March quarter of 1870, 22 per cent. were of infants under one year of age, and the same proportion of persons aged 60 years and upwards. In the same 17 towns in the March quarter of 1871 22 per cent. of the total deaths were again of infants under one year, while the proportion of elderly persons had fallen to 21 per cent. The per-centage of deaths of persons aged 60 years and upwards during this quarter ranged from 16 in Salford and 18 in Bradford, to 29 and 30 respectively in Nottingham and Norwich. To every 100 births registered in these 17 large towns, an average of 16 deaths of infants under one year of age was registered. Infant mortality, measured in this manner, ranged in the several towns from 10 and 13 per cent. in Portsmouth and Norwich, to 19 and 28 in Sunderland and Liverpool. In the large public institutions (principally workhouses and hospitals) of these 17 towns no less than 16 in each hundred of deaths were recorded; this per-centage ranged from 6 per cent. in Bradford and 7 in Leicester, to 18 and 20 per cent. respectively in London and Liverpool. Rather more than 6 per cent. of the total deaths in these towns were registered upon the information of the coroner, being inquest cases, and 3·4 per cent. were referred to different forms of violence. The proportion of deaths from violence in the several towns ranged from 2 per cent. in Nottingham and Sheffield, to 5 and 7 per cent. respectively in Hull and Birmingham. Birmingham usually shows a high per-centage of deaths from violence, but the proportion during this quarter was unduly raised by the registration of the deaths caused by the fatal accident at a large cartridge factory, which occurred in November 1870; these deaths were not registered until January 1871, registration having been delayed by a lengthened coroner's inquiry.

The epidemic of small-pox which more or less generally prevailed throughout the country was doubtless the most important feature in the death returns for the first quarter of the year. The deaths from small-pox in England and Wales in 1864 were 7684, and steadily declined to 6411, 3029, 2513, 2052, and 1565 in the five following years, 1865–9. In 1869 therefore the fatal cases of this disease averaged rather less than 400 per quarter. In the four quarters of 1870 the 2197 registrars of England and Wales reported successively 405, 446, 500, and 1229 fatal cases of small-pox. The recent epidemic may therefore be said to have broken out in the last quarter of 1870, the 1229 deaths in that quarter having further increased to 4903 in the first quarter of 1871. Of these, 2400 occurred in the Metropolitan division; their distribution in the various parts of London has been dwelt upon in the Weekly Returns. In the South Eastern Counties 203 deaths occurred, of which 42 were returned in Brighton, 32 in Croydon, 24 in Southampton, 14 in Medway, and 13 in Kingston. In the South Midland Counties 102 deaths were returned, of which 11 occurred in Staines, 10 in Uxbridge, 12 in Brentford, and 18 in Edmonton; it will be seen that most of these places are in close proximity to the Metropolitan district. In the Eastern Counties 88

deaths were referred to this disease, including 60 in West Ham and Epping, also close to London. In the South Western Counties there were 54 deaths, of which 11 each occurred in Tavistock and Falmouth. Only 40 deaths were returned in the West Midland Counties, with their more than two and a half millions of population; the highest district numbers were 9 in Nuneaton and 8 in Oswestry. In the North Midland Counties, of the 25 deaths 18 occurred in Great Grimsby. In Lancashire and Cheshire, the North Western Counties, 1224 deaths were reported, of which 1062 occurred in Liverpool borough, 43 in Ormskirk district (including Southport), 16 in Birkenhead, 18 in Manchester city, and 10 in Northwich. In the three Ridings of Yorkshire, containing over two millions of inhabitants, only 69 deaths occurred from this disease, including 13 in Keighley and 15 in Kirk Leatham sub-district. In the Northern Counties there were 463 deaths, of which 411 were returned in the county of Durham, including no less than 238 in South Shields, also 78 in Stockton, 37 in Hartlepool, 17 in Durham, 15 in Auckland, and 13 in Gateshead; in Northumberland, 25 and 23 respectively occurred in Newcastle-upon-Tyne and Tynemouth. In the Welsh Counties (with Monmouthshire) 235 deaths occurred; of these 141 were returned in Llanelly, 34 in Swansea, and 11 in Llanfyllin. From this resumé of the distribution of the fatal cases of small-pox it will be seen that the epidemic during this quarter was almost confined to four great centres of infection, London, Liverpool, and the mining districts of Durham and South Wales. Nearly all the smaller outbreaks may be more or less directly traced to one of these centres; Brighton, for instance, doubtless suffered from its intimate communication with London. There is distinct evidence in many cases of the introduction of the disease into sea-side towns by sailors, and considering its fatal prevalence in Holland, Belgium, and many parts of France it is not a matter for great surprise that Southampton, Great Grimsby, and one or two other ports suffered from the epidemic. It is indeed very probable that the epidemic in London was due to the large arrivals of French refugees during the latter part of the previous autumn. That the epidemic may to a great extent be traced to our foreign communications is beyond doubt, and it is to be regretted that the steady decline of deaths from small-pox in England in the six years 1864–9, had induced a certain apathy in the matter of vaccination, and thus left a large portion of the population unprotected from the disease. In times of severe epidemic, large numbers of the vaccinated, in some way or other, also suffer for the neglect which has left so many unvaccinated.

It is interesting to compare the mortality from small-pox in various cities during the quarter. The annual death-rate from this disease in the first three months of the year was equal to 3 per 1000 of the estimated population in London, 8 per 1000 in Liverpool, and 13 in South Shields; in Brussels it was 9, in Bombay 1·4, and in New York ·8 per 1000 respectively. Returns from the Dutch towns were only received for January and February; during those two months the annual death-rate from small-pox was equal to 48 per 1000 in The Hague, 36 in Utrecht, 25 in Rotterdam, and 3 in Amsterdam. It is well known that among the lower classes in Holland a very strong prejudice exists against vaccination. It may be useful to inquire what might be the result in London if prejudice against vaccination, which is so strongly held by a few in this country, should ever become so widely spread as in Holland. If the same death-rate from small-pox had prevailed in London during the quarter as existed in The Hague during January and February, the deaths from this disease within the Metropolitan Division would have been 38,828 during the three months, instead of the 2400 which actually occurred.

Scarlet fever, although showing a decline of 5660 fatal cases upon the last quarter of 1870, continued more or less fatally prevalent during the first quarter of 1871, in nearly all the counties of England and Wales;

it was particularly fatal in Faversham, Kings-Lynn, Highworth, Bideford, Redruth, Chesterfield, West Derby, Halifax, Bradford, and the mining districts of Durham and South Wales. Sharp outbreaks of diphtheria occurred in Minehead (Somersetshire) and in Neston (Cheshire). Measles was epidemic in Birmingham, Liverpool, Manchester, and Bedwelty. Different forms of fever were fatally prevalent in Wycombe, Stow, St. Germans, Dudley, Ashby-de-la-Zouch, Guisborough, Whitehaven, East Ward, and Newtown (Montgomeryshire), besides Liverpool, and the mining districts of Durham and South Wales.

Second Quarter.—April, May, June.

In the UNITED KINGDOM the births of 272,603 children, and the deaths of 161,954 persons of both sexes, were registered in the three months ending on June 30th, 1871. The natural increase of population was thus 110,649.

The number of persons married in the quarter ending June 30th, 1871, was 120,902.

The marriage, birth, and death rates of the Kingdom differ little from those prevailing in England and Wales.

ENGLAND.—The marriage-rate increased, and reflected the brightening prospects of the people; the births did not attain their usually high average. The public health was satisfactory, and the mortality was below the average in town and country in spite of small-pox, which, as vaccination had been neglected, prevailed in London and some other cities.

Marriages.—The marriages of 97,662 persons were recorded in the June quarter of the year. The annual rate in the three months was 17·2 per 1000 against 15·6 and 16·7 in the two previous corresponding quarters. Ths increase in the number of marriages was general throughout the country, but it was most marked in the Northern and West Midland Counties.

Births.—The births of 201,165 children born alive were registered in the second quarter of 1871, and the equivalent annual birth-rate was 35·5 per 1000.

The counties exhibiting a decrease on the average of the three previous corresponding quarters were Suffolk, Lancashire, Herefordshire, Wiltshire, Berkshire, Lincolnshire, Northamptonshire, Oxfordshire, and Cornwall.

In London the decrease was 2·4 per cent.

The Northern group of counties, as in the previous quarter, showed the greatest relative increase.

Increase of Population.—The natural increase of the population, that is the excess of births over deaths, was 80,372 in the three months, or at the rate of 883 per day. The rapid increase was moderated by the steady outflow of emigrants. The spring quarter, as in former years, exhibited an augmented stream of settlers in distant lands. Of 108,438 emigrants who sailed from ports in the United Kingdom at which there are emigration offices, 37,876 were English. Of the remainder, 8545 were Scotch, 36,978 were Irish, and 25,039 were Foreigners. The last merely passed through our ports on the way from their own countries. 86,090 sailed to the United States, 18,304 to British North America, 3058 to the Australian Colonies, and 986 to various other places.

Prices, Pauperism, and the Weather.—The average price of wheat rose to 59*s.* 9*d.* per quarter, being higher than it had been since the June quarter of 1868, when it began to decline from exceptionally high rates which had ruled during the preceding year. Beef by the carcase averaged 6½*d.* per lb. and mutton 7*d.* per lb. at the Metropolitan Meat Market. In

the quarter ending March 1871 the prices were 6⅜*d.* and 6½*d.* respectively. The price of beef had risen during the preceding two years 6 per cent. and of mutton 10 per cent. Potatoes (York Regents) averaged 63*s.* 6*d.* per ton at the Waterside Market, Southwark, being cheaper by no less than 31*s.* 6*d.* and 61*s.* 6*d.* per ton than in the corresponding quarters of the two previous years.

The average number of paupers relieved on the last day of each week in each of the spring quarters of the three years 1869, 1870, and 1871 was as follows:

	In-door.	Out-door.
Quarter ending 30th June 1869	145,094	816,260
" " 1870	144,385	826,396
" " 1871	140,357	806,186

The extreme depression of temperature which prevailed at the end of the year 1870, and during January of the year 1871, after yielding to spring-like warmth, again became low, and the weather was relatively colder in June than in the former months of the year.

During the three months the average temperature was 1°·6 below that of the past 30 years.

Deaths; and the State of the Public Health.—In the second or spring quarter of the year, 120,793 deaths were registered in England and Wales. This number was slightly below that returned in the corresponding three months of 1870, but rather more than 4,000 in excess of the average number in the second quarter of the three years 1868–70. The mortality was at the annual rate of 21·3 per 1000 persons living, somewhat lower than in the corresponding quarters of 1869 or 1870, and 0·6 below the average rate in the second quarters of the ten years 1861–70.

In the 11 Registration Divisions of England the mortality ranged from 19 per 1000 in the South Eastern, South Western, North Midland, Eastern, and South Midland groups of counties, to 23 per 1000 in London, and 25 in both the North Western and Northern Divisions. The small-pox epidemic appears to have governed the rate of mortality during the quarter, as its fatality was principally confined to the three last-mentioned Divisions, in each of which the death-rate showed a considerable excess upon the second quarter of 1870, while in each of the eight others there was a marked decline.

The registrars of the 2197 sub-districts of England and Wales this quarter reported 21,420 fatal cases of the seven principal diseases of the zymotic class, against 18,122 in the corresponding quarter of 1870; 7012 were referred to small-pox, 4210 to scarlet fever, 3269 to different forms of fever, 2306 to measles, 2173 to whooping-cough, 1867 to diarrhœa, and 583 to diphtheria. Compared with the numbers in the second quarter of 1870, those reported from small-pox, measles, and diphtheria showed an increase, while there was a decline in the fatal cases of each of the four other diseases.

In the urban population of the country, comprising all the chief towns, the annual death-rate was 23 per 1000, while in the remaining, or rural population, it was only 19. Nearly half this excess in the town death-rates was due to small-pox, which was principally confined to a few towns.

The mortality in the 20 large cities of the United Kingdom, furnishing weekly return, averaged 25·2 per 1000, against 23·6, 24·1, and 23·1 in the corresponding quarters of the three years 1868–70. The largest excess was shown in London, Birmingham, Liverpool, Salford, Sunderland, and Newcastle; this excess was caused in Birmingham by the fatal prevalence of measles, while in each of the other towns it was due to the epidemic of small-pox, the severity of which was proportionally greatest in Sunderland and Newcastle. The annual death-rate from all causes was under 20 per 1000 in Portsmouth, Bristol, Wolverhampton, and Notting-

ham, while in Sunderland, Newcastle, Liverpool, and Glasgow it exceeded 30 per 1000.

In 50 large English town districts, ranking in respect of population next in size to the 17 largest towns for which weekly returns are published, the annual death-rate averaged 24·4 per 1000, and exceeded by 3·1 per 1000 the general rate in the whole of England and Wales. The rate was lower than 19 per 1000 in Yarmouth, Cheltenham, Shrewsbury, Chatham, Dover, Reading, Northampton, Ipswich, Plymouth (including Plymouth, East Stonehouse, and Stoke Damerel Districts), Walsall, Chester, and York. In Southampton, Stoke-upon-Trent, Bury, South Shields, and Gateshead the rate exceeded 25 per 1000; the excess in Bury was due to the prevalence of scarlet fever, and in each of the other towns to an epidemic of small-pox.

The weather during the second quarter of the year was unseasonably cold, and the continuance of north-east wind was unusually long even for an English spring, indeed it may be said to have prevailed throughout the entire quarter, except between the 12th and 29th of April. Excepting that of 1860, the June of 1871 was the coldest on record since 1821. Of the total deaths in England and Wales during the quarter, 22 per cent. were of infants under one year of age, and 23 per cent. of persons aged 60 years and upwards, leaving 55 per cent. as the proportion of children and adults aged between one and 60 years. The seven thousand deaths from small-pox, which is only to a slight extent fatal among persons aged 60 years and upwards, somewhat disturb these proportions, and especially make the proportion of deaths of elderly persons to appear smaller during this quarter than was actually the case. In the 17 largest English towns, of the total deaths registered in the three months ending June, 23 per cent. were of infants under one year of age, while the proportion of deaths of persons aged 60 years and upwards was only 17 per cent.; the low per-centage of deaths of elderly persons in great measure was due to the excess of deaths of children and adults from small-pox. In the several towns the proportion of deaths of persons aged 60 years and upwards ranged from 12 and 13 per cent. in Salford and Sunderland, to 27 and 29 in Nottingham and Norwich. To each hundred births registered in these 17 large towns, an average of 16 deaths of infants under one year of age was registered. Infant mortality, measured in this manner, ranged in the several towns from 11 and 12 in Nottingham and Wolverhampton, to 20·9 and 22·7 in Newcastle and Liverpool. The annual death-rate from the seven principal zymotic diseases, which in the whole of England and Wales averaged 3·8 per 1000, was 5·9 in these 17 largest towns; in Norwich it was only one per 1000, and in Nottingham but 1·4, while it was 5 in Birmingham and Manchester, 6 in London, 7 in Salford, 9 in Newcastle-upon-Tyne, and 13 in Sunderland. Small-pox was the principal cause of this excess in each of the latter towns except Birmingham, where measles was fatally prevalent. No less than 17 per cent. of the total deaths registered in these 17 towns were recorded in large public institutions, principally workhouses and hospitals, against 15 per cent. in the corresponding quarter of 1870; this increase was due to the large number of fatal cases of small-pox which occurred in the workhouses, and in the established or temporary hospitals. The proportion of these deaths in institutions ranged from 7 per cent. in Bradford, to 17 in Wolverhampton and Liverpool, and 21 in London. Six per cent. of the deaths in these 17 towns during the quarter were registered upon the information of the coroner, being inquest cases. The proportion of deaths from all forms of violence in the 17 towns averaged rather more than 3 per cent.; in Leicester the proportion was only one per cent., while in Bristol and Wolverhampton it was 4·8, and in Birmingham 5·0 per cent.

The recent epidemic of small-pox which may be said to have broken out in the last three months of 1870, caused 1229 deaths in England and

Wales during that quarter. In the first three months of the year 1871 they rose to 4903, and in the quarter ending June they further increased to 7012. Of these, 3241 occurred in the Metropolitan Division, 1120 in the North Western Counties, and 1069 in the Northern Counties; the remaining 1585 were distributed among the seven other registration divisions. It will thus be seen that the principal centres of infection were the same four that were noticed in the Quarterly return for the first three months of the year. London, from which the disease spread into the extra-metropolitan portions of Middlesex, Surrey, and Kent, and also into that part of Essex adjoining the East end of London. Liverpool, from which the infection extended to a considerable number of the other towns in the densely populated Lancashire district, including Manchester, Salford, Bolton, and Wigan, and also, but slightly, into Birkenhead. The third principal centre of infection was the coal districts of the North, more notably the towns of Newcastle, Sunderland, Stockton, and Durham. The fourth distinct outbreak was in the mining districts of South Wales. In London the deaths from small-pox increased from 2400 in the first to 3241 in the second quarter of the year; in Lancashire and Cheshire they declined from 1224 to 1120; they rose in Northumberland and Durham from 461 to 1022; while in South Wales they declined from 207 to 109, although the fatal cases had increased in Swansea. Of the other and smaller outbreaks which cannot be directly traced to any of the above four centres of infection, the following are the most important. Southampton, where the deaths from small-pox increased from 24 in the first quarter of the year to 229 in the quarter ending June; Weymouth, where from two in the first they rose to 39 in the second quarter; Falmouth, which showed an increase from 11 to 27; Bridgwater, which showed 12 deaths in the second quarter; Oswestry, in which 14 deaths occurred in the second quarter; Stoke-upon-Trent, in which district 103 occurred in the second quarter against but one in the first quarter; Nuneaton, in which the numbers were respectively 9 and 26; Coventry, which showed 4 and 14; and Great Grimsby, in which the deaths rose from 18 in the first quarter to 164 in the three months ending June. The three Ridings of Yorkshire, comprising the ninth Registration division, with its more than two and three quarters millions of population, had up to this time comparatively escaped the effects of the small-pox epidemic; in the first quarter of the year the deaths from this disease in Yorkshire were but 69, while in the three months now under notice they had only increased to 98; of these, 21 occurred in Bentham, and 20 in Kirk Leatham sub-districts, the former in the West, and the latter in the North Riding.

In order the better to compare the degree of fatality from small-pox in various parts of the country, it is necessary to take the several populations into account. In the first quarter of the year the annual death-rate from this disease was equal to ·9 per 1000 in the whole of England and Wales; in the three months ending June it rose to 1·4 per 1000. During the June quarter the death-rate from small-pox was 4·0 in the London Division, 1·5 in the Lancashire, 4·3 in Durham, and 2·9 in Northumberland. The annual death-rate from small-pox during the 13 weeks ending 1st July in the different parts of London, after the distribution of the deaths in hospital, was 2 per 1000 in the west group of districts, 3 in the central, 4 in the east, and 5 each in the north and south of London. The death-rates in a few of the larger boroughs which suffered more severely were as follow:—Liverpool 6, Newcastle-upon-Tyne 7, and Sunderland 9 per 1000 persons living. In the following registration sub-districts the death-rates from small-pox were:—Southampton 19, Weymouth 11, Falmouth 8, Longton (Stoke-upon-Trent) 16, Nuneaton 8, and Great Grimsby 22. In nearly all those places which suffered most severely from the epidemic great neglect of vaccination was reported; the omission, however, of the medical profession to state on the certificate of the cause

of death the fact of vaccination or otherwise, renders it extremely difficult to obtain reliable statistics showing the proportion of fatal cases of small-pox in which vaccination had been entirely neglected, or had been inefficiently performed.

Measles showed a fatal prevalence in Birmingham, Manchester, and Salford, Liverpool, Abergavenny, and Bedwelty. Scarlet fever, although showing a decline upon the numbers returned in recent quarters, again exhibited a very general prevalence in the three months ending June, more notably in Lancashire, the West Riding of Yorkshire, Durham, Staffordshire, Essex, Devonshire, and Somersetshire. The greatest fatality from whooping-cough was shown in Lancashire and the West Riding of Yorkshire. The deaths from different forms of fever showed a slight decline upon the corresponding quarter of 1870; Staffordshire, Lancashire, the West Riding of Yorkshire, Durham, and South Wales suffered most from this disease; locally the deaths from fever showed an excess in Walsall, Dudley, Whitwick (Ashby-de-la-Zouch), Warrington, Bishop's Auckland, North Shields, and Swansea. With few exceptions the mortality from fever was principally confined to the large towns. The deaths from diarrhœa registered previously to the 30th June were considerably below the average owing to the low temperature which prevailed throughout that month; and only 26 deaths in the whole of England and Wales during the three months were referred to cholera and choleraic diarrhœa.

Space will not allow a detailed examination of the causes of death in the several registration sub-districts in which an excessive rate of mortality was shown. One instance, however, calls for special notice. In the Much Woolton sub-district of Prescot (457–2), which at the recent enumeration contained a population of 5772 persons, 101 deaths were returned during the quarter, against 29 the average number in the corresponding quarters of the three years 1868–70. These deaths showed an annual death-rate for the three months equal to 70 per 1000 persons living, and included 39 fatal cases of measles, 23 of whooping-cough, and 9 of scarlet fever.

Third Quarter.—July, August, September.

In the United Kingdom the births of 256,116 children, and the deaths of 155,752 persons of both sexes, were registered in the three months ending on September 30th, 1871. The natural increase of population was thus 100,364.

The registered number of persons married in the quarter ending September 30th, 1871, was 114,546.

The marriage, birth, and death rates of the Kingdom differ little from those prevailing in England and Wales.

England.—The Summer marriages of 1871 increased in number, and the average rate was slightly exceeded. The birth-rate remained somewhat below, the rate of mortality was slightly above, the average of the season. Small-pox, nine times as fatal as in the corresponding quarter of the previous year, was yet less fatal than in the preceding spring quarter. Diarrhœa was excessively fatal in the summer, and a certain number of deaths from simple cholera were registered; but fortunately the Asiatic cholera which ravaged the insanitary cities of Russia and some cities on the Baltic did not find its way to England.

Marriages.—In the September quarter of the year 1871, the marriages of 93,072 persons were registered. The annual rate for the quarter was 16·2 per 1000 which only slightly exceeded the average rate for the summer quarter in the 10 years 1861–70, though it showed a more considerable increase upon the rate of 15·5 which prevailed in the corresponding quarter of the previous year. The greatest increase occurred in Lanca-

shire, the West Riding of Yorkshire, and Cumberland, while a decrease took place in Cambridgeshire, Dorsetshire, Somersetshire, and Shropshire.

Births.—The births of 193,271 children born alive were registered in the third quarter of 1871, and the equivalent annual rate was 33·7 per 1000.

The births were below the average of the three previous corresponding quarters in London, and in the South Midland, Eastern, South Western, and North Midland Divisions; in other parts of England they showed an increase.

The Counties of Suffolk, Hereford, Wilts, and Berks, which exhibited a decrease in number in the June quarter, showed an increase in September.

In London a decrease again appeared equal to 2·4 per cent. upon the average number in the corresponding quarter of the three previous years.

Increase of Population.—The natural increase of the population, that is, the excess of births over deaths was 71,939 in the three months, or at the rate of 782 daily.

Of 71,400 emigrants who sailed from ports in the United Kingdom at which there are Government emigration officers, 32,312 were of English, 5862 of Scotch, and 16,139 of Irish origin; 14,587 were Foreigners, and the nationality of 2500 was not stated. The English emigrants were nearly 3000 more than in the corresponding quarter of the previous year, but those of Scotch origin had declined. Of the English, 91 per cent. sailed to the United States and to British North America.

Prices, Pauperism, and the Weather.—The average price of wheat was 57*s.* 9*d.* per quarter, and except that it was 2*s.* per quarter lower than in the previous June quarter, it was higher than it had been since the middle of 1868. Beef, by the carcase, averaged 6¾*d.* per lb., and mutton 7½*d.* per lb. at the Metropolitan meat market. In the quarter ending June, the prices had been 6½*d.* and 7*d.* respectively. Potatoes (York Regents) averaged 68*s.* 6*d.* per ton at the waterside market, Southwark; and although rather dearer than in the preceding quarter, they were considerably cheaper than during the corresponding periods of the previous two years.

The average number of paupers relieved on the last day of each week in the summer quarters was much lower in 1871 than it was in the two preceding years:

		In-door.	Out-door.
Quarter ending 30th September	1869	137,406	781,382
" "	1870	138,283	789,409
" "	1871	132,067	769,764

The cold weather of spring reigned, with a few exceptions, through the beginning of summer until it was succeeded on August 5th by 42 days of very warm genial weather running up to September 16th. From this time to the end of the quarter the weather again became cold, and heavy rain fell everywhere. The crops which had been backward were forced by the fine weather rapidly to maturity, and by the end of August a large portion of them had been stacked. Complaints prevailed of the potato disease, and the wheat crop was generally held to be deficient. The rainfall was 8·3 inches, nearly double that of the same period of 1870 but slightly below the average.

Of the 4·1 inches of rain which fell at Greenwich during September no less than 3·3 fell in the last week of the month.

Deaths; and the State of the Public Health.—In the third or summer quarter of the year, ending 30th September, 121,332 deaths were registered in England and Wales: this number was nearly 3000 less than that returned in the corresponding quarter of 1870.

The mortality was at the annual rate of 21·1 per 1000 persons living, against 22·0 in the same period of 1870, and all but corresponded with

the average rate in the same three months of the ten years 1861–70. Temperature exercises an undoubted influence upon the rate of mortality, more especially the extremes of cold and heat in winter and summer. Following an unusually cold June, the mean temperature during July was moderate and ruled somewhat below the average; August, however, was so exceptionally hot that its mean temperature, 64°·8, was only equalled or exceeded on four occasions during the 100 years 1771–1870. The effect of this heat was shown in the rapid increase of the fatality from diarrhœa.

The annual death-rate from all causes ranged from 17 per 1000 in the South Western, and 18 in the South Eastern and Welsh Registration Divisions, to 25 in the North Western, and 28 in the Northern Divisions. The three first-named Divisions contain for the most part counties of a rural character; while the North Western Division comprises Lancashire and Cheshire, and the Northern includes Durham and Northumberland. The manufacturing towns of Lancashire ordinarily show in the third quarter of the year an excessive death-rate from infantile diarrhœa, and Northumberland and Durham suffered during the quarter under review from a severe epidemic of small-pox.

In the urban population of the country comprising all the chief towns, and including about 13 millions of persons, the annual death-rate was 24·0 per 1000; while in the remaining or rural population the rate did not exceed 17·4 per 1000. The town death-rate was slightly above the average rate in the corresponding quarter of the ten years 1861–70, while that in the country districts was about as much below the average. Town and country death-rates usually show the widest divergence in the summer quarter of the year, owing to the far greater fatality from diarrhœa which prevails among town populations. During this quarter ending 30th September 1871, 21,663 persons died in our large and small towns who would have lived, had the urban death-rate not exceeded that which prevailed in the rural districts. There are many reasons why a town under perfect sanitary organization should show a death-rate fully as low as that which prevails in purely rural districts, but apart from the evils arising from impure water supply, and the difficulties which surround a satisfactory disposal of sewage, thousands of lives are each month sacrificed to ignorance or disregard of the first sanitary principles. The necessity for ventilation in dwellings, more especially where they are small and overcrowded, and for cleanliness of person, and some knowledge of the physical construction and requirements of the human body, should be taught in all our schools. Such instruction would soon have an important bearing on the public health.

In the seventeen largest English towns furnishing weekly returns the mortality during the quarter was 26 per 1000, and differed but slightly from that which prevailed in the corresponding periods of 1869 and 1870, while it was considerably below the rate during the remarkably hot summer of 1868. The lowest rates among these towns were Portsmouth 19, Wolverhampton 20, and Bristol 21; the highest rates Manchester 34, Salford 35, Newcastle-upon-Tyne 38, and Sunderland 46. Diarrhœa was more or less fatal in each of the towns, and small-pox showed especial fatality in Newcastle and Sunderland, while it was also prevalent in London, Liverpool, Manchester, and Salford.

In the fifty large town districts, ranking in respect of population next in size to the seventeen largest English towns, the annual death-rate in the September quarter averaged 24 per 1000, or two per 1000 less than in the seventeen largest towns. The rate was below 19 per 1000 in Dover, Cambridge, Devonport, Bath, Cheltenham, Shrewsbury, and Chester; in Wigan, Bolton, Preston, South Shields, and Gateshead the rate exceeded 30 per 1000. In Wigan, Bolton, and Preston diarrhœa was exceptionally fatal, while South Shields and Gateshead suffered severely from small-pox.

By the returns received from the 2195 registrars of sub-districts in England and Wales it appears that during the three months ending

30th September 1871, 4612 deaths were referred to small-pox, 1688 to measles, 3488 to scarlet fever, 474 to diphtheria, 1845 to whooping-cough, 3362 to different forms of fever, and 15,919 to diarrhœa; thus from the seven principal diseases of the zymotic class, 31,388 deaths resulted during the quarter, against 33,963 in the corresponding quarter of 1870. The deaths referred to scarlet fever, diphtheria, fever, and diarrhœa showed a decrease, while the fatal cases of small-pox, measles, and whooping-cough were more numerous. To simple cholera and choleraic diarrhœa 527 deaths, principally of infants, were referred, against 611 in the third quarter of 1870. Small-pox and diarrhœa caused an exceptionally high mortality in the quarter now under consideration.

The recent epidemic of small-pox first became fatally prevalent during the last quarter of 1870, resulting in 1229 deaths in England and Wales. In the first two quarters of 1871 the fatal cases were 4903 and 7012 respectively. In the three months ending 30th September they declined to 4612, of which 1255 occurred in London, 89 in Hampshire, 82 in Essex, 90 in Staffordshire, 92 in Warwickshire, 92 in Lincolnshire, 555 in Lancashire, 1120 in Durham, and 396 in Northumberland. The fatal cases showed a large increase upon those in the preceding quarter in Durham and Northumberland, and were also somewhat more numerous in the South Western, West Midland, and York Registration Divisions; in all the other divisions they showed a decline. In London the deaths from small-pox declined from 3241 in the second quarter of the year, to 1255 in the third quarter. In the South Eastern Division during the September quarter they were most numerous in Southampton, Gosport, and Dartford. In the South Midland Division in Brentford and Oxford. In the Eastern Division very few fatal cases occurred out of West Ham which adjoins the Metropolitan Division. In the South Western Counties the disease was epidemic in Weymouth, Falmouth, and Bridgwater, but very few fatal cases occurred in other parts of the division. In the West Midland Division the greatest fatality occurred in Oswestry, Stoke-upon-Trent, Wolverhampton, Nuneaton, and Coventry. In the North Midland Counties the fatal prevalence of small-pox was principally confined to Great Grimsby, although a few deaths were also returned at Leicester and Nottingham. Of the 615 deaths from small-pox in Lancashire and Cheshire, 150 were returned in Liverpool, 182 in Manchester and Salford, and the remainder were scattered for the most part among the large manufacturing towns of Lancashire. In Yorkshire the disease showed fatal prevalence in Sheffield, Scarborough, and Kirk Leatham. In Durham the disease was very generally prevalent; Stockton, Durham, Sunderland, South Shields, and Gateshead, being the principal centres of infection. In Northumberland, the towns of Newcastle-upon-Tyne, Tynemouth, and Morpeth suffered most from the disease; in Cumberland it was fatally prevalent in Carlisle and Cockermouth. In the Welsh Division the returns showed fatality from small-pox in Chepstow, Bedwelty, Newport, Swansea, and Brecknock. The information with regard to vaccination or otherwise in fatal cases of small-pox is necessarily incomplete, failing the co-operation of the medical profession. In but a small proportion of the cases does the certificate of the cause of death state whether the deceased has been vaccinated or not; and although the registrars have in some cases been instructed to enter this information in the death register on the authority of the informant, it is to be feared that this is not always reliable. Frequently the informant is not aware of the fact, and it is suspected that in many instances vaccination is falsely stated to have taken place to conceal the neglect on the part of the parents, who have some dread of ulterior prosecution. All the 20 deaths from small-pox in Bridgwater were "not stated" as to vaccination, as were the 16 in Nuneaton, the 15 in St. Helens (Prescot), the 11 in Kirk Leatham, the 22 in Harraton, and also the 10 each in Chepstow and Brecknock. In the districts of Sunderland, South Shields, Gateshead, and Newcastle-

upon-Tyne, 1023 deaths from small-pox were registered last quarter; of these 329 were returned as unvaccinated, 137 as vaccinated, and 557 as "not stated." Great neglect of vaccination is proved by these figures, but the neglect is probably much understated, for whereas there may be considerable doubt whether the whole of the above 137 had been successfully vaccinated, it is pretty certain that but very few were falsely returned as unvaccinated, and inquiry has proved that of the "not stated" by far the larger proportion are generally unvaccinated.

The fatality from diarrhœa which had been below the average for the season up to the beginning of August, afterwards showed a rapid increase, reached its maximum about the end of the month, and continued excessive throughout the rest of the quarter. The annual death-rate from the disease in England and Wales during the three months was 2·8 per 1000, against 3·1 in the corresponding period of 1870, when the mean temperature was 60°·7 instead of 61°·3 as in the quarter ending September 1871. The lower mortality from this disease is probably due to the cold June, and to the moderate temperature during July, which retarded the outbreak of the epidemic. It is somewhat remarkable, however, that whereas the general diarrhœa death-rate in England and Wales was lower during the summer of 1871 than in the corresponding period of 1870, the rate in the seventeen largest English towns, including London, showed an increase. In the seventeen largest towns this rate was 5·1 per 1000, in the fifty next largest towns 3·7, and in the whole of England and Wales, exclusive of these sixty-seven towns only 1·6 per 1000. Of these sixty-seven towns it was under 2 per 1000 in Gosport, Southampton, Oxford, East Stonehouse, Halifax, Newport (Monmouth), Merthyr Tydfil, and Swansea; while it was 8 per 1000 in Preston, Colchester, and Leeds, 9 in Manchester, Salford, Bolton, and Wigan, and 11 in Leicester. With regard to the excessive death-rate from diarrhœa in Leicester, Dr. J. Wyatt Crane, the Medical Officer of Health, denies that it can be due to the insanitary condition of the town in the ordinary signification of those words. He considers that the mortality from the disease is due to a diminished capacity in the individual who is attacked with the disease to withstand its depressing effects, and that it will especially "be greater or less "in proportion to the vigour of the infantile population;" and further that "the excessive diarrhœal mortality in Leicester, as compared with "that in other manufacturing towns, arises from its position, situated "as it were in a basin, which causes it to suffer from a more extreme "degree of heat." If it be true that the excessive death-rate from diarrhœa in Leicester is due to a want of "vigour in the infantile population," and it is probably true of the infant population of many of our large towns, it becomes a social question of the first importance, which certainly comes within the region of sanitary inquiry, how far this want of vigour in town children is due to causes directly within human control.

Measles, which showed in the September quarter of 1871 a somewhat greater fatality than in the same period of 1870, was most prevalent in Staffordshire, Lancashire, and Monmouthshire. Scarlet fever was fatal in Halstead, Bury Saint Edmunds, Thingoe, and Ipswich Districts; in Brighton, Southampton, Hitchin, several parts of Oxfordshire, Poole, Bodmin, Redruth, Tewkesbury, Wolstanton, Stoke-upon-Trent, Warwick, Oakham, in many of the manufacturing towns of Lancashire and the West Riding of Yorkshire, Darlington, Sunderland, Newport (Monmouth), and Glamorganshire. The fatal cases of different forms of fever were proportionally excessive in the districts of Chippenham, Bideford, Chard, Ashby-de-la-Zouch, Bingham, Liverpool, Leeds, Sunderland, Llanelly, and Holywell. The deaths from whooping-cough were excessive in Plomesgate, Thetford, Birmingham, Newcastle-upon-Tyne, and Haverfordwest.

The 121,236 deaths registered from all causes in England and Wales during the quarter included 37,367 or 30·8 per cent. of infants under one year of age, and 23,536 or 19·4 per cent. of persons aged 60 years

and upwards; in the corresponding quarter of 1870 these proportions were almost identical, 30·9 and 19·4 per cent. respectively. Infant mortality, measured by the proportion of deaths of children under one year, to births registered, was 20·0 per cent. in 1870, and 19·4 in the third quarter of 1871. Infant mortality calculated in this manner was 27·6 per cent. in the seventeen largest English towns, 23·4 in the entire urban population, and only 16·0 in the remaining or rural districts. Among the 17 largest towns, the proportion of deaths under one to births registered ranged from 16·9 and 18·8 per cent. in Wolverhampton and Portsmouth, to 35·1 in Leeds, 35·2 in Liverpool, 37·3 in Manchester, and 46·2 in Leicester. This difference between the average proportion of 16 per cent. among the ten millions of persons living in the rural districts, and the 46 per cent. shown in the borough of Leicester is so remarkable that an exhaustive inquiry into the cause of this terrible infant mortality seems imperatively called for. The inhabitants of Leicester, and of other large towns, should know the cause of this waste of life, the reason why their infants more readily fall victims to diarrhœa and other infantile complaints.

In the large public institutions of England and Wales, including the Workhouses, Hospitals, and public Lunatic Asylums, 9782 deaths were returned, or 8·1 per cent. of the total deaths; in the corresponding quarter of 1870 the number was 9185 and the proportion 7·4 per cent. In the 17 largest English towns the proportion of these deaths this quarter was 12·6 per cent., ranging from 4·6 and 4·9 in Leicester and Bradford, to 11·3 in Liverpool and Manchester, and 16·7 per cent in London. There is no doubt that some considerable proportion of the deaths occurring in the public institutions of our large towns are of patients admitted from outlying districts, from parishes not included within the several municipal boundaries. Town rates of mortality are thus to a slight extent over-stated, not however more than is balanced by the deaths of domestic servants and other town workers who, when ill, return to their country homes, there die of diseases contracted during their town residence, and are there registered.

Inquests were held during the quarter upon 6032, or 5·0 per cent. of the deaths registered in England and Wales; in the corresponding quarter of 1870, 5526 or 4·4 per cent. were inquest cases. In the 17 largest English towns the proportion of inquest cases ranged from 2·4 and 2·9 per cent. in Sunderland and Wolverhampton, to 5·5 and 7·7 per cent. in London and Birmingham. Different forms of violence caused 4202 or 3·5 per cent. of the deaths in England and Wales; in the 17 largest towns the proportion ranged from 1·4 per cent. in Leicester and Salford, to 3·8, 4·1, and 4·2 per cent. respectively in London, Birmingham, and Hull.

Fourth Quarter.—October, November, December.

In the United Kingdom the births of 256,439 children, and the deaths of 175,878 persons of both sexes, were registered in the three months ending on December 31st, 1871. The natural increase of population was thus 80,561.

The registered number of persons married in the quarter ending December 31st, 1871, was 143,558.

The marriage, birth, and death-rates of the Kingdom differ little from those prevailing in England and Wales.

England.—The Marriages in the last quarter of 1871 exceeded the ordinary excess of the season. Births abounded, and exceeded the numbers in any preceding autumn, but the average rate was scarcely reached. The deaths were raised to the extent of seven thousand over the average

by the severity of the weather; and the mortality was above the average. especially in the towns of the kingdom. Small-pox, owing to defective administrative arrangements, was, in spite of the Compulsory Vaccination Act, more fatal than any other epidemic: of it more than six thousand died, chiefly children. The deaths by fever, chiefly enteric, occur more among men and women of maturer ages; the number of such deaths was 4692.

Marriages.—In the quarter ending 31st December 1871, 116,880 persons were married, a greater number than had been recorded in any previous quarter. The annual rate was 20·4 per 1000, which was higher than that in any quarter since the corresponding one of 1866, and ·8 above the mean rate for the fourth quarter of the 10 years 1861–70. On comparison with the average number of marriages registered in the corresponding quarter of the three years 1868–70, the English counties in which the greatest increase occurred, in proportion to population, were Nottinghamshire, Durham, Warwickshire, and Monmouthshire, while Westmorland was the only county which showed a decrease.

Births.—The number of children born alive, whose births were registered in the quarter ended 31st December 1871, was 193,469, giving an annual rate of 33·7 per 1000, which is about the average rate for the fourth quarter of the year. As compared with the average of the three previous corresponding quarters, Leicestershire, Nottinghamshire, and Durham were the only counties exhibiting any noticeable increase, and Hertfordshire, Bedfordshire, and Herefordshire those in which any considerable decrease occurred.

Increase of Population.—The excess of births over deaths amounted during the quarter to 59,108 or 642 per day. This represents the natural increase of the population, which would be also the actual increase, if it were undisturbed by emigration and immigration.

The number of emigrants who sailed from British ports at which Government emigration officers are stationed, was 40,114. Of these, 18,621 were of English, 2997 of Scotch, and 9135 of Irish origin, and 9361 were Foreigners. It is amongst this last class that the increase of 1654 over the total number of emigrants in the previous corresponding quarter principally occurred. Emigration to the Australian Colonies again showed a decline.

Prices, Pauperism, and the Weather.—The average price of wheat, which had gradually risen from 42*s.* 3*d.* per quarter in the March quarter 1870, to 59*s.* 9*d.* in the June quarter 1871, fell to 57*s.* 9*d.* in the September quarter, and further declined to 56*s.* 3*d.* per quarter in the last three months of the year.

The price of beef and mutton by the carcase at the Metropolitan Meat Market averaged 6½*d.* and 6¾*d.* per lb. against 6¾*d.* and 7½*d.* per lb. respectively in the previous quarter. Potatoes (York Regents) fetched an average price of 89*s.* 6*d.* per ton at the Waterside Market, Southwark, showing an advance of 21*s.* per ton upon the price in the preceding quarter, and of 19*s.* 6*d.* upon that in the corresponding quarter of the preceding year.

The average number of paupers relieved on the last day of each week of the quarter was —

	In-door.			Out-door.
	141,027	-	-	759,666
against	150,864	-	-	804,219

in the previous corresponding quarter.

The last quarter of the year 1871 was remarkable for the longest continuance of low temperature during November and the first half of December in this century. The temperature of the month of October had been nearly a degree below the average, but on the 2d November a period of cold

weather set in of unprecedented length, continuing throughout the whole month. The mean temperature of this month was 37°·6, being 4°·7 below its average derived from 100 years observation. In two instances only, viz., in the years 1782 and 1786, was the mean temperature of November lower than 37°·6, and since the year 1786, that is in the previous 85 years, there had been no instance of such a cold November. The cold continued into December and with severity until the 12th day, the average deficiency of the mean daily temperature from the 1st to the 12th being 9¼°. On the 8th December the deficiency reached 19°·3, the mean temperature of that day having been 22°·4, while its average is 41°·7.

The rain-fall during the quarter, as measured at Greenwich, amounted to only 3·2 in., being 4 in. below the average.

The fall of rain in October was only one half of the average for that month; in November it was only one fourth; and in December it was three fifths of its average; thus the rain-fall in each month of the quarter was defective.

State of the Public Health; Deaths.—In the fourth or autumn quarter of 1871, ending 31st December, 134,361 deaths were registered in England and Wales: a considerable excess was shown upon the number returned in recent corresponding quarters, after making due allowance for increase of population.

The mortality was at the annual rate of 23·4 per 1000 persons living, against 22·2 the average rate in the fourth quarters of the ten years 1861–70; in those ten years the annual rate ranged from 20·6 in the last three months of 1861, to 23·5 in 1864, the latter rate corresponding with that which prevailed during the quarter under review. Independently of the continued fatality from the small-pox epidemic, the unusually severe weather which prevailed during the greater part of November and the first 12 days of December exercised an unquestionable influence upon the mortality of the latter part of the quarter by causing an excessive fatality, especially from diseases of the respiratory organs and phthisis.

In the Eleven Registration Divisions of England and Wales the annual death-rate from all causes ranged from 17·6 and 19·9 per 1000 in the South-eastern and South Midland, containing for the most part agricultural counties, to 27·8 in the Northern and 27·9 in the North-western Divisions. The largest proportional excess of deaths, upon the average numbers in the three previous corresponding quarters, was shown in the counties of Staffordshire, Monmouthshire, and Durham. In Staffordshire, small-pox was severely epidemic in Wolverhampton, and scarlet fever in Stoke-upon-Trent and Wolstanton; while small-pox was the principal cause of the excess in Monmouthshire and in Durham. In the county of Durham the death-rate from all causes was so high as 31·5 per 1000.

The principal town districts of the country, comprising all the large towns, contained a population of about 13 millions of persons, among which the annual death-rate for the quarter was equal to 26·4 per 1000. The remaining or rural population was about 10 millions, in which the death-rate did not exceed 19·5 per 1000. Compared with the average rate in the corresponding quarter of the ten years 1861–70 the town death-rate showed an excess of 1·7 per 1000, while in the rural districts the excess was but 0·8 per 1000. During the three months ending 31st December 1871, in our principal towns 22,585 persons died (26 per cent. of the total deaths) who would have survived had the death-rate in these towns not exceeded that which prevailed in the whole of the rural districts of England and Wales. It is especially this waste of life in towns which it is hoped to control and reduce by effective sanitary legislation. The above figures, however, give but a faint idea of the entire excess of mortality, as the sanitary condition of a considerable proportion of our villages and rural parishes is far from satisfactory. How can it be otherwise where

there is absolutely no system adopted for the disposal of animal refuse, and the only sources of water supply are surface wells? In a selection of the healthiest districts of England the average annual death-rate is found to be 17 per 1000; at this rate the deaths in England and Wales during the four quarters of 1871 would have been 386,926, instead of the 515,096 actually registered. The total excess of mortality over a normal standard during 1871 may therefore be put down as 128,170 deaths, being the difference between the number registered and those which would have occurred if the death-rate during the year had not exceeded 17 per 1000.

In the 17 largest English towns furnishing weekly returns during the quarter the mortality averaged 27 per 1000, and showed a considerable excess upon that which prevailed in the corresponding quarter of 1870; this is principally due to the epidemic of small-pox prevailing in so many of the towns, and causing 2666 deaths, against 773 in the last three months of 1870. The lowest death rates among these towns in the December quarter of 1871 were 22 in Portsmouth, 24 in Hull and Birmingham, and 25 in Bradford; the highest 34 in Nottingham and Norwich, 41 in Sunderland, and 47 in Wolverhampton. Small-pox was fatally epidemic in each of the four last-mentioned towns, as well as in Sheffield, Newcastle-on-Tyne, and to a less extent in London.

The annual death-rate in 50 large town districts, ranking in respect of population next in size to the 17 largest English towns, averaged 28 per 1000, against 24 in the preceding three months, when diarrhœa was so fatal. This increased mortality, and the excess of 1½ per 1000 upon the general urban death-rate, was almost entirely due to the greater fatality from small-pox. The rate was below 19 per 1000 in Chatham, Maidstone, Reading, and Cheltenham; while it exceeded 35 per 1000 in East Stonehouse, Devonport, Stoke-upon-Trent, Preston, Gateshead, and Newport (Monmouth); scarlet fever was the principal cause of this excess in Stoke-upon-Trent, and measles in Preston, while small-pox was epidemic in East Stonehouse, Devonport, Gateshead, and Newport (Monmouth).

The 134,387 deaths registered at all ages, from all causes, in England and Wales, included 30,320, or 22·6 per cent., of infants under one year of age, and 32,535, or 24·2 per cent., of persons aged 60 years and upwards; in the corresponding quarter of 1870 the proportions were 21·7 and 23·2 per cent. respectively. The larger proportion of deaths of infants, and of elderly persons, registered during the quarter under review, was probably due to the greater fatality from diseases of the respiratory organs induced by the unseasonably severe weather which prevailed during the greater part of November and the first half of December. Infant mortality, measured by the proportion of deaths under one to births registered, was 15·7 per cent., against 14·4 in the corresponding three months of 1870. In the 17 largest English towns the proportion of deaths under one to births registered averaged 18·0 per cent., and ranged from 15·5 in Hull and 16·0 in Bristol, to 21·6 in Leicester and Liverpool, and 30·8 in Wolverhampton. This remarkably high per-centage in Wolverhampton may in great measure be the result of the fatal prevalence of small-pox in that town; during the fourth quarter of 1870 the proportion of deaths under one to births registered in the town did not exceed 13·3 per cent.

According to the returns furnished by the 2195 local registrars of the sub-districts in England and Wales relating to the three months ending 31st December 1871, 6380 deaths were referred to small-pox, 3763 to measles, 4498 to scarlet fever, 635 to diphtheria; 2966 to whooping-cough, 4692 to different forms of fever, and 4063 to diarrhœa; thus 26,997 deaths resulted from these seven principal diseases of the zymotic class, against 25,907 in the corrresponding three months of 1870. The fatal cases of scarlet fever and diphtheria showed a decline of more than 7000, and of fever nearly 700, while those of small-pox, measles, and whooping-cough

had increased 5151, 1882, and 1211 respectively. The deaths from these seven principal zymotic diseases were equal to an annual death-rate of 4·7 per 1000 persons living in England and Wales; in the 17 largest English towns, including London, the rate from these diseases was equal to 5·9, and in the 50 large towns ranking next in size to 6·6 per 1000. In these 67 towns the zymotic rate ranged from 1·3 per 1000 in Cheltenham and 1·4 in Derby, to 18·9 in Sunderland and 21·7 in Wolverhampton.

The continued prevalence of the small-pox epidemic was again one of the most conspicuous features of the Return. During the six years 1864–9 the deaths from small-pox steadily declined from 7684 to 1565. In the four quarters of 1870 they were successively 405, 446, 500, and 1229, giving a total for the year of 2580. The recent epidemic may therefore be said to have broken out in the last quarter of 1870. During the March quarter of 1871 the fatal cases rose to 4903, in the June quarter to 7012, and after a decline to 4612 in the three months ending September, rose again to 6380 during the last quarter of the year. Thus in the twelve months ending 31st December 1871 no less than 22,907 children and adults in England and Wales fell victims to this disease. Who shall say how much of this mortality, which is entirely without parallel in England during the past 30 years, is directly due to neglect and apathy as to vaccination induced by the comparative immunity from the disease which the nation enjoyed during the three years 1867–8–9? Of the 6380 deaths from small-pox registered during the quarter in England and Wales, 1084 occurred in the county of Durham, 980 in London, 708 in Yorkshire, 474 in Lancashire, 419 in Northumberland, 361 in Staffordshire, 327 in Norfolk, 261 in Devonshire, 247 in Monmouthshire, 183 in Nottinghamshire, 168 in Warwickshire, and 167 in Somersetshire. In Durham, London, and Lancashire these numbers showed a decline upon those in the preceding three months ending September, while there was a considerable increase in most of the other above-mentioned counties. It will be useful briefly to notice the rise or fall of the epidemic in various parts of the country. In London the fatal cases, which fell from 3241 in the second to 1255 in the third quarter, further declined to 980 during the three months ending 31st December; these, however, showed a weekly average of 75, and towards the end of the quarter the weekly numbers were considerably higher than during October and November. The South-eastern Counties, excepting slight outbreaks at Gillingham and Dover, and 38 deaths in Portsmouth and Alverstoke districts, were almost free from the disease. In the South Midland Counties, the fatal cases showed a decline in the extra-metropolitan portion of Middlesex, while they were again numerous in Oxford, and comparatively recent outbreaks occurred at Northampton, Kettering, and Wisbech; Buckinghamshire was the only English county in which no death from small-pox was recorded during the quarter. In the three Eastern counties, Essex, Suffolk, and Norfolk, the disease showed a markedly increased fatality, resulting in 426 deaths against 105 in the three months ending September; in Essex the numbers were lower than in the previous quarter, and, excepting Mutford district, which includes a portion of Yarmouth borough, there was but a slight increase in Suffolk; in Norfolk, however, both Norwich and Yarmouth became centres of infection, and the fatal cases in the county rose from 13 in the September quarter to 327, of which 233 occurred in Norwich; the medical practitioners in that city have so generally omitted to mention the fact of vaccination or otherwise in their certificates of the cause of death, that it is impossible to ascertain the extent to which vaccination has been there neglected. The South-western Counties, more especially Devon and Somerset, also showed a large increase in the fatality from small-pox, the deaths rising from 156 in the September quarter to 536, of which 261 occurred in Devonshire and 167 in Somersetshire; the disease was epi-

demic at Swindon and Bridport, Bideford, Bodmin, Redruth, Bridgwater, Yeovil, and to a slight extent in that portion of Bristol city situated in Bedminster; by far the most important centre of infection, however, in these South-western Counties was Plymouth and the adjoining districts of East Stonehouse and Stoke Damerel, in which 197 deaths occurred. In the West Midland Counties, the fatal cases showed an increase from 212 to 569; the epidemic, however, was principally confined to Staffordshire and Warwickshire, the main centres of infection being Wolverhampton and Coventry, and to a slight extent Birmingham; the fatality was exceptionally severe at Wolverhampton, 267 deaths occurring within the borough. The North Midland Counties showed 234 deaths, against 121 in the preceding three months; Nottingham became a new and important centre of infection during the quarter, and 161 fatal cases were recorded in the borough and its immediate vicinity; the epidemic had all but died out at Great Grimsby and in other parts of Lincolnshire, and the counties of Leicester and Derby were comparatively free from the disease, excepting a slight outbreak at Chesterfield. In the North-western Counties of Cheshire and Lancashire the epidemic showed a slight decline upon the September quarter, but the disease continued fatally prevalent to a greater or less extent in Chester, and in most of the large manufacturing towns of Lancashire; there was a marked decline in Liverpool and Manchester, while the numbers had considerably increased in Prescot, Salford, Oldham, and Rochdale. Yorkshire, in which 129 fatal cases were returned in the September quarter, lost 708 lives in the last three months of the year; of these, 360 occurred within the borough of Sheffield, 40 in Wakefield, 38 in Hull, and 67 at Scarborough; throughout the county an important and general increase was shown. The mining districts of the Northern Counties had been one of the most fatal small-pox fields since the outbreak of the epidemic; during the four quarters of the year 1871 the deaths from this cause were respectively 463, 1069, 1566, and 1546, or 4644 for the whole year; the number showed a slight decline in the December quarter in Durham, but the considerable decrease in both Sunderland and Newcastle was all but balanced by a large increase in Auckland, Easington, and Tynemouth. In the Welsh Division, including Monmouthshire, the fatal small-pox cases rose from 141 in the September quarter, to 539 in the quarter ending 31st December; the most important increase occurred in Monmouthshire, 144 and 75 deaths being respectively returned in Bedwelty and Newport Districts; in South Wales an important outbreak occurred at Neath, causing 118 deaths, and the epidemic was more or less fatal in Merthyr Tydfil, Swansea, Carmarthen, Brecknock, and Crickhowell; in North Wales, except at Holywell and St. Asaph, very few deaths occurred from the disease.

The mere numbers quoted in the foregoing epitome, although indicating those parts of the country in which small-pox was prevalent, and showing whether its fatality was on the increase or decline, afford slender means for judging the rate of mortality from the disease at the different centres of infection. Throughout the year rather more than one in every thousand persons living in England and Wales died from small-pox; during the last quarter of the year the rate averaged 1·1 per 1000. In the 17 largest English towns the 2666 deaths from small-pox were equal to an average annual rate of 1·7 per 1000 of the six millions of the population; the highest rates were 6·0 in Sheffield, 6·1 in Nottingham, 11·7 in Norwich, and 15·6 in Wolverhampton. In the 50 large towns ranking next in size the fatal small-pox cases were 983, and the rate 1·6 per 1000, or almost identical with that in the 17 largest towns; among these fifty towns the highest small-pox rates were 10·3 in Stoke Damerel (Devonport) district, and 13·2 in South Shields, and 8·8 in Newport (Monmouth) sub-districts. In England and Wales, exclusive of these 67 large towns, the deaths from small-pox were 2731 and the annual rate

0·8 per 1000. In many parts of the country the death-rate from this cause was very high, especially in the following registration sub-districts, 13·7 in Houghton-le-Spring, 13·8 in Bridgwater, 14·5 in Whitford (Holywell), 15·8 in Bideford, 16·3 in Wallsend, and 20·0 in Neath.

The 3763 deaths referred to measles in England and Wales during the quarter ending 31st December 1871, showed an increase of 2075 upon the preceding three months, and were 1882 above the number in the fourth quarter of 1870. The greatest fatality was shown in London, Staffordshire, and Lancashire; the deaths were also especially numerous in Folkestone, Plymouth, Birkenhead, and Merthyr Tydfil. Of the 951 deaths in Lancashire the more remarkable sub-district numbers of fatal cases were 91 in St. Helens (Prescot), 121 in Burnley, and 122 in Preston.

Scarlet fever caused 4498 deaths against 3488 in the preceding three months, the largest increase being shown in Cornwall, Staffordshire, Lancashire, Yorkshire (West Riding), and Durham. The disease was fatally prevalent in Newport Pagnell, Chelmsford, Halstead, Thingoe, Poole, Redruth, Wolstanton, Stoke-upon-Trent, West Derby, Bury, Todmorden, Whitehaven, and Pontypridd.

Whooping-cough is usually more fatal during cold weather, and the 2966 deaths in the December quarter exceeded by 1211 those in the corresponding three months of 1870. Manchester, Birmingham, and Bradford showed a considerable fatality, as well as a large proportion of the town districts of Staffordshire, Lancashire, and Durham, which also suffered more or less from small-pox, measles, and scarlet fever.

The 4692 deaths referred to different forms of fever, but principally enteric, also showed an increase of 1330 upon those in the preceding three months, although they were 672 less than in the last quarter of 1870. The increase upon the September quarter was general, and as usual was largest in the town districts; in Nottinghamshire the increase was exceptional, 185 deaths being referred to this head against 88 in the previous three months.

The fatal cases of diphtheria shared the increase shown in those of scarlet fever. Those of diarrhœa exceeded by about 1000 the number in the corresponding quarter of 1870. To English cholera and to choleraic diarrhœa 60 deaths were referred, of which 6 were reported at the village of Carlton near Nottingham, and certified by the medical attendant as English cholera.

This general view of the distribution of zymotic disease in England during the quarter, apart from the small-pox epidemic, can scarcely be said to be satisfactory. The deaths referred to most of these diseases had increased, and thus implied a low sanitary condition. Towns were the greatest sufferers, but villages and rural districts were in many instances, perhaps unconsciously, also suffering from excessive death-rates. Take for example the two registration sub-districts of Missenden and Chesham, situated in the most picturesque part of Buckinghamshire, with so sparse a population that they contain an average of from $2\frac{1}{2}$ to 3 acres to each person living; in Missenden the fatal prevalence of measles and whooping-cough raised the annual death-rate to 44 per 1000; while in Chesham measles and typhoid fever, in addition to the ordinary mortality, produced a death-rate of 49 per 1000. In such rural districts the rate should certainly not exceed 17 per 1000, if their sanitary condition were satisfactory. These are chance examples, and many more striking ones might be discovered by an exhaustive examination of the death-rate in villages and rural parishes. With a proper use of these returns, no part of England and Wales, however remote, need any longer remain in ignorance of its sanitary condition as shown by the proportion of deaths to its population, the number of deaths referred to the principal zymotic diseases, and its infant mortality measured by the proportion of deaths of children under one year to births registered.

In the large public institutions of England and Wales, including Workhouses, Hospitals, and public Lunatic Asylums, 11,531 deaths were returned or 8·6 per cent. of the total deaths; in the corresponding quarter of 1870 the number was 10,621 and the proportion 8·4 per cent. In the 17 largest English towns the proportion of these deaths averaged 13·6 per cent., and ranged from 5·4 and 6·6 per cent. in Bradford and Sheffield to 14·7 in Liverpool and 16·4 in London. During the quarter 6423 deaths in England and Wales were registered upon the information of the coroner, being inquest cases, or 4·8 per cent. of the total deaths, against 4·9 per cent. in the corresponding quarter of 1870. In the 17 largest English towns the proportion of inquest cases averaged 5·8 per cent., ranging from 1·9 in Wolverhampton to 8·6 per cent. in Birmingham. Different forms of violence, principally the result of accident or negligence, caused 4048 or 3·0 per cent. of the deaths in England and Wales, against 3292 and 2·6 per cent. in the fourth quarter of 1870; the proportion in the 17 largest English towns ranged from one per cent. in Norwich, to 4·5 and 5·2 respectively in Birmingham and Liverpool.

Health of London and other large Cities in 1871.*

Cities, although no longer the heads of States, created as in Greece and Rome by their energy, are the seats of government, commerce, industry, trade, science, and literature; in England, too, they comprise a large and an increasing proportion of the nation. Besides the indigenous population, they attract the enterprising part of the people born in the country. Their diseases serve to measure the fluctuations in the health of the whole community, of which they are a part, or with which they are in intimate and constant relation. Hence, while the Returns for other districts are made quarterly, Returns are now procured weekly, under special arrangements, from London and twenty of the largest cities of the United Kingdom.

The area of the Weekly Tables has been extended as their utility in recent epidemics has become evident; so that by persevering application, the authorities have been induced to furnish returns similar to those of London, though less complete, from Paris, Rome, Berlin, Vienna, in Europe; from Bombay, Madras, and Calcutta in Asia; and from New York in America. The sanitary state of a large portion of the population of the civilized world is thus reflected; and immediate intimation is given of any epidemic arising in the horizon, even when the cloud is no bigger than a man's hand.

The thousand millions of people in the world are in many ways bound together, simply because they are of the same species, and have wants in common, which are satisfied by the interchange of the productions of various climes through commerce. But they have this still more intimate element of solidarity, that from physical sympathy they are affected by each other's health and sicknesses. A man dies of cholera in the valley of the Ganges, and the disease there generated, like a consuming fire, visits Europe, Africa, and America; a child in Arabia has small-pox, and the disease of this child spreads and exterminates tribes of North American Indians; the plague, born in Egypt or Ethiopia, prostrates the population of the Roman Empire, and sweeps away at intervals through centuries a large proportion of the populations of Athens, Florence, London, and other large cities.

The solidarity here appears to be an evil, inasmuch as it visits on all, the sanitary sins of a few; but in reality the punishment is so graduated as to pass lightly over the heads of nations which have complied with the

* Reprinted from the "Annual Summary for 1871.

conditions of human existence. and only to destroy utterly the cities which wallow in impurities, and by ignorance, negligence, or wilfulness, violate the laws of healthy life. But there is on the other hand this compensating element; the discovery of the laws of public health, the determination of the conditions of cleanliness, manners, water supply, food, exercise, isolation, medicine, most favourable to life in one city, in one country, is a boon to every city and to every country, for all can profit by the experience of one; a hygienic truth once established by facts, becomes as general in its application as a truth in chemistry.

The class of zymotic diseases deserves especial attention; they give rise to all the epidemics, and may be popularly explained on the assumption that their phenomena are the effect of changes in man and in the higher animals, wrought by the invasion of self-multiplying molecules of the lowest, simplest forms of life, having this in common with the highest forms, that they succeed each other in generations, with the marvellous variations of number so commonly observed in vegetable blights, fungi, flies, locusts, and parasites. The precautions commonly adopted, have had in view the isolation of the sick, which in the cases of leprosy, hydrophobia, and syphilis, where the zymotic matter is fixed in a solid or fluid, proves effectual at least, in restraining the disease within narrower limits than it would otherwise attain. Few people contest the propriety of isolating lepers, as it was done under the Mosaic law; neither is it considered an evil to shut up dogs in times when hydrophobia is common; but a large party in the country disputes, on various grounds, the policy of restraining women from sowing syphilis through the land, and insists on reversing the policy now in operation, which is certainly calculated to diminish the chances of its extension among all classes of people, including an indeterminate number of children. The question may be looked at from a moral, as well as a physical point of view; but it is evident that either man or woman who goes on communicating a disease so injurious as syphilis is to the human race is a living nuisance, to be suppressed by the laws in the mildest way, but to be suppressed at any reasonable cost. In London the deaths from syphilis are imperfectly reported, as they are often referred to secondary diseases; but the same system of reporting which showed a rapid increase from 288 in the year 1859 to 473, 466, and 463 in the years 1868–70, showed a decline to 356 in the year 1871.

Another method of limiting the diffusion of disease is illustrated by vaccination, where the milder form of disease protects the system to a great extent against the danger of future attacks of small-pox. In spite of the compulsory vaccination Act, this disease was epidemic in 1871, and in London alone killed 7876 persons. Several of these persons had been vaccinated; but the great bulk of them had never been vaccinated at all, and certainly had never had the true cow-pox. The Act was imperfect from the first, the work was in itself difficult, and its administration was not at all calculated to overcome the opposition to its operation. The result is the signal failure here proved by 13,174 deaths from small-pox in the year 1871 among the population of 17 large English towns.

The other zymotic diseases, as is often the case, were less active in the year; the great epidemic of scarlet fever, so fatal in the two previous years, subsided, and in 1871 was fatal, in the 17 largest English towns, to 4253 persons. In hygienic matters it is right to take precautions against the entrance into a city of zymotic diseases of any form; but, as in the case of vaccination, it is not sufficient to stop disease of one kind while the causes of diseases of all kinds abound in air, water, soil, house, food; it is necessary to take the whole condition of the city into account, and to leave none of those causes in operation by which health is destroyed, life embittered, and generations debased. This can be done under a simple practical sanitary code.

Large Towns of the United Kingdom.—During the 52 weeks of 1871, among the rather more than seven millions of people living in London and the 19 other large cities of the United Kingdom furnishing Weekly Returns, the birth-rate was equal to 36 per 1000, and the death-rate to 27. The birth-rate differed but slightly from that in the previous year, while the death-rate showed an increase of 2 per 1000. In Dublin the rate was 26, in Edinburgh 27, while in Glasgow it was so high as 33, which among the English towns was only exceeded by the rates in Liverpool and Sunderland. The Census enumeration in April 1871 showed that the population of Edinburgh had been considerably under-estimated in recent years, while it had been overstated in Dublin. In Dublin the population was all but stationary during the ten years 1861–71.

English Large Towns.—In 17 of the largest English towns, and in 50 other large town districts, it is estimated, from the numbers enumerated in April 1871, that 8,728,324 persons were living at the middle of that year, among whom 316,891 births, and 226,935 deaths were registered during the year, the birth-rate being equal to 36, and the death-rate to 26 per 1000; in the 17 largest towns the death-rate was 26·5, while in the 50 towns ranking next in size it did not exceed 24·8. In the population of England and Wales, exclusive of these 67 towns, the death-rate was 21 per 1000. This difference occurred principally in the death-rate from the seven principal zymotic diseases, which was 6·5 in the 17 largest towns, 5·3 in the 50 other towns, and 3·4 in the rest of England and Wales; among the 50 towns small-pox was only severely epidemic in Southampton, South Shields, and Gateshead, while in the 47 others the death-rate from the principal zymotic diseases ranged from 1·8 and 2·1 per 1000 in Cheltenham and Exeter, to 8·3 in both Wigan and Stoke-upon-Trent. The death-rate from all causes in these 50 towns was under 20 per 1000 in Dover, Chatham, and Cheltenham; while it exceeded 30 per 1000 in Stoke-upon-Trent, Preston, South Shields, and Gateshead.

In the 17 largest English towns furnishing Weekly Returns, and including London, the birth-rate was 36·2 per 1000, and ranged from 33 in Nottingham and 34 in Norwich, to 41 each in Sunderland, Salford, and Leicester. The death-rate averaged 26·5 per 1000; it did not exceed 19 in Portsmouth and 23 in Hull and Bristol, while it was 31 in Manchester, 32 in Newcastle, 35 in Liverpool, and 37 in Sunderland. The small-pox epidemic was the principal cause of the excess in the three latter towns. Influenced partly by the seasons, and partly by the varying fatality from the small-pox epidemic, the annual rate of mortality from all causes in the 17 towns was 28 in the first, 24 in the second, 26 in the third, and 27 in the fourth quarters of the year; the highest annual rate was 34 in the 50th week of the year, and the lowest 21 in the 27th week, or the beginning of July. The weekly deaths from small-pox in these 17 towns, which were 133 in the first week of the year, rose to 370 in the fifth week of the second quarter, and were 371 in the last week of June; the weekly numbers declined during the third quarter to 120 in the second week of September; during the last quarter of the year they rose again steadily, and averaged 287 in the last three weeks of December. In the first quarter of the year the small-pox epidemic in these 17 largest towns was almost confined to London and Liverpool, in the second quarter it became fatally prevalent in Newcastle and Sunderland, while in the last quarter of the year, Norwich, Wolverhampton, Nottingham, and Sheffield suffered severely from the disease, which was also prevalent to a slighter extent in Manchester and Salford. The 13,174 deaths in the 17 towns referred to small-pox during the year imply a death-rate of 2·1 per 1000 persons living. The death-rate from the seven principal diseases of the zymotic class in these towns, including small-pox, averaged 6·5 per 1000, while in 1870 it was only just below 6 per 1000; it is evident therefore that the greatly increased fatality from

small-pox was nearly balanced by a decline in the deaths from the other diseases. To scarlet fever only 4253 deaths were referred in the 17 towns in 1871, against 11,054 in 1870; and different forms of fever caused but 4857 deaths against 5475. Measles and whooping-cough were slightly more fatal than in 1870. In the several towns the lowest death-rates from these seven diseases were 3·2 in Portsmouth, 3·5 in Bristol, and 4·3 in Hull; and the highest, 8·1 in Salford, 9·3 in Newcastle-upon-Tyne, 11·4 in Liverpool, and 15·5 in Sunderland.

The 164,419 deaths from all causes in the 17 largest English towns during 1871 included 43,113 or 26·2 per cent. of infants under one year of age, and 29,906 or 18·2 per cent. of persons aged 60 years and upwards; these proportions were almost identical with those which prevailed in the same 17 towns during 1870. Infant mortality, measured by the per-centage of deaths under one year to births registered, averaged 19·2 in the 17 towns, against 18·3 in 1870; in the several towns this per-centage ranged from 14·4 and 16·5 respectively in Portsmouth and Bristol, to 24·1 in Leicester and 26·9 in Liverpool. The proportion of deaths of elderly persons to deaths at all ages in the several towns ranged from 12·7 per cent. in Salford and 13·8 in Sheffield, to 23·6 in Bristol and 25·0 in Norwich.

In the large Public Institutions of the 17 towns no less than 24,261 deaths were recorded in 1871, showing a proportion equal to 14·8 per cent. of the total deaths, against 13·5 in 1870; this increase was in great measure due to the deaths occurring in temporary small-pox hospitals established to meet the exigencies of the epidemic. The per-centage of deaths in public institutions was 18·2 in London and 16·1 in Liverpool, while it was only 5·8 in Bradford and 7·3 in Sheffield. It is somewhat remarkable that notwithstanding the severity of the small-pox epidemic in Sheffield during the last quarter of 1871, resulting in 360 deaths, no special small-pox hospital appears to have been established, and the deaths recorded in the established workhouses and hospitals situated within the borough were actually below the numbers recorded in the first and second quarters of the year.

During the year 9483, or 5·8 per cent., of the deaths were registered in the 17 towns upon the information of the coroner, being inquest cases; in the previous year 8881 inquests were registered, or 5·6 per cent. of the total deaths. The highest proportions of these inquest cases were 6·2 per cent. in London, 6·6 in Manchester, and 9·2 in Birmingham. The deaths referred to different forms of violence in large towns show a constant increase; in the 17 largest English towns 5273 deaths were caused by violence, principally resulting from negligence (which is returned as accidental), against 4982 in 1870. The per-centage of these violent deaths in 1871, which averaged 3·2 in the 17 towns, ranged from 1·9 and 2·2 respectively in Leicester and Salford, to 3·9 in Liverpool and 5·1 in Birmingham. This excess of deaths from violent causes in Birmingham was as conspicuous in 1870 as in 1871.

London.—The number of persons enumerated in April 1871 within the registration district of London, was 3,254,260, while in 1801 it was but 958,863. The revised area is given as 78,080 acres, or 122 square miles; this includes 2718 acres of the Thames. The mean density of population in this area was 42 persons per acre; in 1801 it was only 12, while it successively increased at each Census enumeration to 36 in 1861. In the Central Districts at the last Census the mean density was 150, while it was 107 in the East, 56 in the North, 52 in the West, and only 21 in the South districts which include considerably more than half the entire area of London. Among the 137 registration sub-districts this density ranged from 1 person per acre in Eltham, and 3 each in Lewisham and Dulwich, to 410 and 418 respectively in St. Andrew and White-

cross sub-districts of Holborn, and 429 in Berwick Street sub-district of Westminster.

The decennial increase of population in the whole of London, which had been 21·2 and 18·7 per cent. in the two decades 1841–51 and 1851–61, further declined to 16·1 per cent. between 1861–71. In the central group of districts, including, besides the City, St. Giles, Strand, and Holborn, the population had decreased 12·8 per cent. between 1861 and 1871; while the increase was 11·9 in the East, 21·6 in the North, 22·5 in the West, and 25·2 in the South groups of districts. It is but natural that the increase of population should be largest where the density of population is smallest, that is where there still exists most land still uncovered with buildings. We may therefore fairly expect that the largest increase during the present decade will occur in Hammersmith and Fulham in the West, Hampstead in the North, and in Norwood, Wandsworth, Putney, Streatham, Dulwich, Eltham, Lewisham, and Charlton in the south group of districts. In each of these sub-districts the number of persons enumerated to an acre in 1871 showed that a considerable portion of their area still remains to be built over. The most remarkable case of increase of population between 1861 and 1871 occurred in Battersea sub-district, in which the number of persons rose from 19,600 in 1861 to 54,016 in 1871, the increase being equal to 176 per cent. The largest decrease was shown in Queenhithe sub-district of the City; here the population fell from 8570 in 1861 to 4753 in 1871, a decrease of nearly 45 per cent.; in the sub-district of St. Olave, Southwark, the decrease was equal to 43 per cent.

In London during the year 1871, 112,617 births and 80,430 deaths were registered; the natural increase to the population of the Metropolis by excess of births over deaths was therefore 32,187. The birth-rate was equal to 34·5 per 1000, and was 1·7 per 1000 below the average rate in the 17 largest English towns. The birth-rate varies to a remarkable extent in different sections of the population; this variation is governed by the ages, proportion of the sexes, conjugal condition, and social position of the people. For instance, the birth-rate per 1000 in Christchurch sub-district of the City was but 14, and in St. James's Square 15, while it was 40 in Hoxton Old Town, 41 in Haggerston East, and 44 in St. James, Bermondsey, sub-districts. In the five groups of districts the birth-rate for the year averaged 30 in the West, 34 in the North, 32 in the Central, 39 in the East, and 36 in the South.

The 80,430 deaths in London included 19,244 or 23·9 per cent. of infants under one year of age, and 15,541 or 19·3 per cent. of persons aged 60 years and upwards; these proportions were almost identical with those observed in 1870. Infant mortality measured by the proportion of deaths of infants under one to births registered was 17·1 per cent., or 2·1 lower than the average proportion in the 17 towns. Among the deaths of elderly persons 2807 were registered at 80 years of age and upwards, against 2738 during 1870.

The deaths at all ages in London included 7912 which were referred to small-pox, 1427 to measles, 1902 to scarlet fever, 344 to diphtheria, 2291 to whooping-cough, 1691 to different forms of fever, and 3887 to diarrhœa; in all 19,454 or 24·2 per cent. of the deaths from all causes resulted from these seven principal diseases of the zymotic class, against 16,489 in 1870. The deaths from these causes in 1871 were equal to six per 1000 of the population. The death-rate in the year from small-pox was 2·4 per 1000. The fatal cases of measles differed but slightly from those in the previous year; the weekly numbers were continually below the average during the first three quarters of the year, while a considerable increase was shown in the three months ending December. Scarlet fever which had been fatally epidemic in most parts of the Metropolis during 1869 and 1870, causing 5841 and 6040 deaths respectively, showed a considerably

smaller fatality during 1871 resulting in but 1902 deaths, of which 722 occurred in the first quarter of the year; excepting 1866 and 1867 scarlet fever was less fatal in London in 1871 than in any of the twelve years 1859–70. The 344 deaths from diphtheria corresponded with the number in 1870; the deaths referred to this disease have steadily declined in London since 1861–2–3, previously to which they were not separately classified from scarlet fever. The 2291 deaths from whooping-cough exceeded by 335 those in 1870, while they were 1478 below the number in 1869. Of the 1691 deaths referred to fever, 384 were classified as typhus, 871 as enteric or typhoid, and 436 as simple continued fever. It is a satisfactory sign of the improving sanitary condition of the Metropolis to find that the deaths referred to different forms of fever have steadily declined from 3703 in 1864 to 1691 in 1871. Excepting the year 1868, when the summer heat was so remarkably high, the 3887 deaths referred to diarrhœa, of which 3122 occurred in the third quarter, considerably exceeded the number in any year since 1859.

To different forms of violence 2557 deaths in London were referred during 1871, against 2390 and 2529 in 1869 and 1870; of these, 2144 resulted from negligence or accident, including 924 from fractures and contusions, 266 from burns and scalds, 50 from poison, 285 from drowning, and 498 from suffocation, nearly all cases of infants. During the year 293 cases of suicide, and 107 of murder or manslaughter were registered; nearly all the latter were cases of infanticide. The deaths from fractures and contusions included 228 caused by horses or vehicles in the streets; the numbers of these fatal accidents were 210 in 1869 and 229 in 1870. The deaths from all forms of violence showed a proportion of 3·2 per cent. of the total deaths, corresponding exactly with the average proportion in the 17 largest English towns. The number of violent deaths registered in London is doubtless raised to an appreciable extent by cases of injury occurring in the suburban districts, which are admitted to the London hospitals, and proving fatal are therein registered. Inquests were held on 4968, or 6·2 per cent., of the total deaths in London; in the previous year the inquest cases were 4949.

No less than 14,562 deaths in London, or 18·1 per cent. of the total deaths, were recorded in the large Metropolitan public institutions; of these, 6669 occurred in workhouses, 7422 in hospitals, 314 in lunatic asylums, 81 in naval and military asylums, and 76 in prisons. These deaths in institutions showed an increase of 1937 upon those in 1870, a result principally due to 2718 being recorded in the permanent and temporary small-pox hospitals; of these, 1151 occurred in that at Hampstead, 654 at Stockwell, and 613 at Homerton.

The death-rate from all causes in London was 24·6 per 1000, and higher than in any year since 1866 when cholera was epidemic; exclusive of the deaths from small-pox the rate would have been but 22·2 per 1000. The male death-rate was 26·6, while among females it did not exceed 22·8 per 1000; at the recent Census there were 113·7 females living in London to each 100 males. In the several groups of districts the death-rate of persons was 22·5 in the West, 25·6 in the North, 25·0 in the Central, 26·2 in the East, and 24·1 in the South. The deaths recorded in the public institutions form a most disturbing element in calculating local rates of mortality in the various districts and sub-districts of London; unless the 14,562 deaths in institutions could be correctly distributed among the sub-districts from which the inmates were received the several death-rates could not be satisfactorily ascertained. After distributing these deaths among the five groups of districts, in proportion to those occurring among the normal population of each of the groups, the corrected death-rates per 1000 become 22·8 in the West, 23·8 in the North, 24·4 in the Central, 26·8 in the East, and 25·1 in the South. By comparing these corrected rates with the uncorrected ones quoted above it will be

seen, that the rates in the North and Central groups were unduly raised by an excessive proportion of deaths in institutions, while the rate for the South Districts was under-stated.

Metropolitan Water Supply. The daily supply to London is about 107 millions of gallons; of this according to Dr. Frankland's periodical reports 20 millions is "good wholesome water from wells and springs in the chalk," and 87 millions is "more or less impure water derived from polluted rivers." The Chelsea and Lambeth Companies draw their supplies from the Thames after it has received the polluted Mole, and the sewage of 600,000 people, including the filth of Oxford, Reading, and Windsor. The West Middlesex, Southwark, and Grand Junction Companies draw their water from the Thames above the junction with the Mole, but after it has received the sewage of the three above mentioned towns, as well as of smaller places. The East London Company takes its supply of water from the Lea, below the sewer outfalls of Luton, Hertford, and Ware. The Lea, however, is less polluted than the Thames, and, as Dr. Frankland remarks, it is to be "regretted that the East "London Company has just spent about 500,000*l.* in conveying water "from the Thames to their works in the Lea valley." The New River Company draws rather more than half its supply from chalk wells, and the rest from the river Lea above the sewer outfalls of Hertford and Ware, but below those of Luton, Whitwell, and Welwyn. The Kent Company is the only one of the Metropolitan Companies which draws its entire supply from chalk wells and does not distribute any water from polluted rivers; "this water is uniformly excellent for drinking and all domestic purposes, but is too hard for washing." The average relative proportions of organic impurities contained in the different companies' water at the several analyses during 1871 may be stated as follows:—Kent 1, New River 2, West Middlesex, East London, and Chelsea each 6, Grand Junction and Lambeth 7, and Southwark and Vauxhall 8. With regard to filtration, the West Middlesex and New River Companies delivered clean and transparent water on all occasions when tested; the Chelsea water was more or less turbid on 5 occasions out of 15, the Southwark on 4 out of 13, the Grand Junction on 4 out of 15, the Lambeth on 7 out of 14, and the East London on 3 out of 13. As the Kent water is drawn entirely from deep chalk wells it is not filtered before delivery, and the natural filtration it receives through the chalk is so superior to the best artificial filtration that this company's water has never for several years past shown any signs of turbidity. The Chelsea and Lambeth Companies, however, "periodically deliver water so muddy as to be entirely unfit, on this "account alone, for domestic use." Living organisms were found during 1871 in most of the turbid samples delivered by each of the Companies drawing their supplies from the Thames, excepting only the West Middlesex which on all occasions sent out well filtered water.

Metropolitan Main Drainage. According to weekly returns furnished by the Engineers of the Metropolitan Board of Works, the average daily quantity of sewage pumped into the river Thames at Crossness was 226,905 tons (=230,545 cubic metres), and at Barking 246,143 tons (=250,092 cubic metres); in 1870 the daily quantities averaged 204,121 and 177,847 tons. The large increase in the amount pumped at Barking was probably due to the progress made in the low level sewer on the north side of the Thames, which was only partially used during the first part of 1870. The influence of the rain-fall upon the amount of sewage pumped does not appear to be very direct; for instance, at Crossness the average daily quantity during the September quarter, when the rain-fall was 8·3 inches, was 234,939 tons (=238,708 cubic metres), while in the December quarter, with a rain-fall of but 3·2 inches, the daily average of sewage was 213,047 tons (=216,465 cubic metres).

Foreign Cities. Weekly returns are received from Paris, Berlin, Vienna, Brussels, Rome, Florence, and Turin ; but the continuity of the series in 1871 having been broken, in the case of Paris and Berlin by the war, and in the case of the other cities by interruptions from various causes, a summary for the year cannot be furnished.

The mortality in the Dutch towns was excessive during 1871 owing to a fatal epidemic of small-pox ; the death-rate from all causes was equal to 46 per 1000 in Rotterdam, 44 in Utrecht, 41 in the Hague, and 34 in Amsterdam ; the small-pox rate was 14 per 1000 in both Rotterdam and the Hague.

In Calcutta the deaths registered during the 52 weeks of 1871 were 10;467, showing a death-rate of 24 per 1000 of the population (430,000 persons) enumerated in 1867 ; of these 10,467 deaths, 4013 or 38 per cent. were referred to remittent fever. In Madras 13,034 deaths were registered during the 52 weeks of the year, and the death-rate calculated on the population of 427,771, as enumerated in 1863, was 30 per 1000. In Bombay the deaths from all causes (exclusive of still-born) during the same period were 16,008, giving a death-rate of 20 per 1000 of the population 816,562 as enumerated in 1864. Remittent fever was again the most fatal disease, having caused 5442 deaths; small-pox was fatal in 921 cases.

An annual return furnished by Dr. Chas. P. Russel, Registrar of Records to the Health Department of the City of New York, shows that, during the 12 months ending 31st December 1871, 26,976 deaths occurred in that city, giving an annual rate of mortality of 29, the population being estimated at 942,292. These 26,976 deaths included 805 from small-pox, 409 from measles, 791 from scarlet fever, 238 from diphtheria, 465 from whooping-cough, 306 from different forms of fever, and 3653 from cholera and diarrhœa. The total number of deaths from these eight diseases of the zymotic class was 6667, equal to an annual rate of 6 per 1000, corresponding with the death-rate in London during the year from the same eight diseases.

Remarks on the Meteorology of 1871. By James Glaisher, Esq., F.R.S., &c.

The several meteorological values in 1871 differed but very little from their respective averages. The rain-fall was in excess of that in the previous year, but still in defect of the average of the preceding 23 years, and the mean temperature of the air was also nearly one degree below the average.

The principal meteorological features of 1871 were, the unusually warm temperatures during February and March; the cold inclement weather during May and June; the extremely low temperatures recorded during the early portion of December, and the scarcity of rain during the last quarter of the year.

The annual means of the various elements at the several stations between Guernsey and North Shields are shown in Table 38, pages xciv–xcv.

These results naturally varied considerably at the several stations, but, so far as concerns the excess or deficiency above or below the average, the observations at the Royal Observatory may be taken as generally applicable to the whole country.

Atmospheric pressure. The readings of the barometer oscillated above and below the average several times during the first few days of January, but on the 13th a rapid fall commenced, and reached its minimum 28·73 in. by 9 a.m. of the 16th; a steady increase was recorded after this, and with but few interruptions continued till the end of the month; the range of readings for the month was 1·36 in.

During February the mean daily readings were principally above the average, the range of reading in the month amounting to 1·20 in. In March several oscillations were recorded, the range being nearly the same as in the preceding month. During April, May, and June, the movements were generally small, especially so in May, in which month the maximum was 30·21 in., and the minimum 29·64 in. The changes of atmospheric pressure were small in amount, but frequent, during July, the tendency, however, being towards higher values in the middle than at the beginning and end of the month. The maximum value, 30·06 in. occurred on the 6th, and the minimum 29·24 in. on the 25th, thus giving a range of 0·82 in.

In August the oscillations were larger than in July, the principal movements being an increase to 30·02 in. on the 10th, a decrease to 29·26 in. on the 18th, an increase to 29·80 in. on the 21st, a decrease to 29·56 in. on the 24th, an increase to 30·31 in. on the 28th, and a decrease to 29·82 in. on the 30th. During the next two months the movements were numerous and rapid; on the 1st October the recorded value was 28·9 in.; an increase then set in, and 30·3 in. was reached on the 13th, but during November few movements of the barometric column of any magnitude were experienced. From December 1st to 18th, high values were recorded, the daily means without exception being in excess of the average, but from the latter day to the end of the year there were several movements, a tendency being shown to decrease.

Temperature. The very cold weather at the end of the last quarter of 1870 continued till January 5th, when it somewhat moderated, and a few days of little milder temperatures were experienced. On the 19th the cold weather returned and continued to February 2nd; taking the temperature for the 33 days ending this day, the average deficiency of daily temperature was $3\frac{3}{4}°$. From the 3rd February to the 14th March the weather was occasionally spring-like, but from the latter date to the end of the quarter very changeable, the temperatures being for periods of two

or three days considerably in excess, and then again for similar brief periods considerably in defect of the average. With the exception of the period comprised between April 9th and 12th, the temperatures were almost continuously below the average (on some days to large amounts) throughout the quarter ending June 30th. The average daily excess of temperature during the exceptional period above-mentioned was 4°, and the average daily deficiency for the remaining 73 days exceeded 2½°. The direction of the wind from April 12th to 29th was generally S.W., and during the rest of the quarter generally E. or N., or a compound of these directions. The low temperature was the most severe at the beginning and end of June, and the deficiency of temperature for this month from the average of the preceding 30 years exceeded 4° daily. The month of June 1860 was of the same low temperature, but previous to that we must go back as far as the year 1821 for one of lower temperature. The cold weather continued with slight exceptions till August 5th. This was followed by a period of 42 days of warm and genial weather, extending from August 6th to September 16th, during which interval the mean excess of temperature above the average was 4½° daily.

From this time to the end of September the weather was again cold, and heavy rain fell everywhere.

During October constant alternations of warm and cold temperatures were experienced, but during November and to the 12th December a period of cold weather was prevalent. The mean temperature of November was 37°·6; in the period 1771–1870 there have been but two years when a lower value than this has been recorded, viz., 1782, 34°·7, and 1786, 36°·7. The mean defect for the first 12 days of December was no less than 9¼°, the mean departure for the 7th, 8th, and 9th exceeded 14°, that for the 8th being as large as 19°·3.

(The cold was more severely felt in Norfolk than elsewhere; the minima at Holkham, Norwich, and Somerleyton being respectively 7°·6, 9°, and 9°·7; the temperatures were not particularly low at Guernsey, in Cornwall, near the West Coast, nor in Northumberland; but the cold was generally intense at a short distance inland from the south coast, and throughout the Midland Counties).

From the 13th December to the end of the year the temperature was in excess to the average amount of 3½° daily.

Rain-fall. The fall of rain or snow was somewhat large in January, being two tenths of an inch above the average, but in both February and March it was half an inch in defect. The amounts collected during April, and June were respectively 1·3 in. and 1·1 in. in excess of the average fall, but in May 1·3 in. in defect. In July and August light falls were generally experienced, but in September heavy rain fell everywhere, the amount measured being rather more than 4 inches. The fall in October was only one half its average, in November one fourth, and in December three fifths.

The rain-fall of the year at the Royal Observatory amounted to 22·3 in., which was 1·6 in. below the average of 23 years, but 3·8 in. excess of the fall of the previous year.

At the several observation stations furnishing reports, the rain-fall of the year varied from 20·1 in. at Royston, and 20·8 in. at Cardington, to 43·4 in. at Stonyhurst and Allenheads, and 41·6 in. at Helston. Rain fell on 132 days at Cardington, and on 272 days at Stonyhurst. At the Royal Observatory rain was measured on 162 days.

PRELIMINARY TABLES.

TABLE **1.**—Estimated **Population,** and Number of **Marriages, Births,** and **Deaths** registered in **England** in each of the Thirty-four Years **1838–71.**

YEARS ended Dec. 31st	Estimated POPULATION in ENGLAND in the Middle of each Year.*	MARRIAGES.	PERSONS MARRIED.	BIRTHS (exclusive of Still-born).	DEATHS (exclusive of Still-born).	EXCESS OF BIRTHS OVER DEATHS.
1838	15,287,699	118,067	236,134	463,787	342,760	121,027
1839	15,514,255	123,166	246,332	492,574	338,984	153,590
1840	15,730,813	122,665	245,330	502,303	359,687	142,616

NOTE.—The Table may be read thus:—In the year 1838 to every 10,000 persons living there were 154 persons married, 303 births, and 224 deaths; the number of persons living to every person married, birth or death, was 65, 33, and 45 respectively. The rates in this Table have been calculated upon the estimated populations given in Table 1, but no corrections have been made for the difference between an ordinary year of 365 days and leap year.

TABLE **3.—Marriages** in **England** in each of the Thirty-one Years **1841–71**; those solemnized according to, and not according to, the Rites of the Established Church; with other details respecting the Marriages in the Churches of the Established Church.

Years ended 31st December	Total Marriages.*	According to the Rites of the Established Church.						Not according to the Rites of the Established Church.					
		Special Licence.	Licence.	Banns.	Superintendent Registrar's Certificate.	Not stated.	Total in Established Church.	Total not in Established Church.	In Registered Places. * Roman Catholics.	In Registered Places. Other Christian Denominations.	Superintendent Registrar's Office.	Quakers.	Jews.

1871 -	36,305	48,831	46,536	58,440	12·9	17·2	16·2	20·4
Mean Annual Rate per 1000 in each quarter - -					13·7	16·8	15·8	19·5

Note.—The three months January, February, and March contain 90 days, and in leap year 91 days; the three months April, May, and June 91 days; and each of the two last quarters of the year 92 days. For this inequality a correction has been made in the above calculations.

* These rates may thus be read without reference to the decimal points:—In the March quarter of 1838, to 10,000 persons living, there were 124 persons married.

TABLE 7.—**Proportional Number** of **Persons Married** in the several **Counties** of **England** during the Year **1871**; of Persons who **signed the Register with Marks**; of Persons not of **full Age**; and of **Re-marriages.**

Mean Annual Rate per 1,000 in each Quarter - -					35·4	35·1	32·5	32·3

* These rates may thus be read without reference to the decimal points:—In the March quarter of 1838, to 10,000 persons living there were 303 births registered. In the calculation of these rates a correction has been made for the varying number of days in the different quarters, *see* note to Table 6.

TABLE **13.—Proportional** Number of **Births** in **England** in each **Quarter** to **1000 Births** in the **Average Quarter*** of each of the Thirty-four Years **1838–71.**

Years.	Number of Births in the Average Quarter.	Proportional Number of Births.				
		In the Average Quarter (assumed to be 1000).	First Quarter ending March 31.	Second Quarter ending June 30.	Third Quarter ending Sept. 30.	Fourth Quarter ending Dec. 31.

Average proportion in 34 years, 1838–71 - -			23·3	21·5	104	109

The Table may be read thus:—In the year 1838 to every 1000 males living there were 23·4 deaths; to every 1000 females living there were 21·5 deaths; and to each 100 females who died there were 105 deaths of males. The last column shows the *relative* mortality of *males* and *females;* and that out of equal *numbers living* the deaths of males were as 109 to every 100 deaths of females in 1838.

TABLE **18.—Deaths** of **69 Persons** RETURNED as **Aged 100 Years and upwards** in ENGLAND and WALES during the Year **1871.**

DIVISION.	COUNTY.	DISTRICT.	SEX.	AGE.	CAUSE OF DEATH.
I.	Middlesex (*Metropol.*)	Pancras	Female	100	Old Age.
	"	Shoreditch	Male	106	Diarrhœa.
	"	"	Male	102	Old Age.
	"	Bethnal Green	Male	103	Ditto.
	Surrey (*Metropolitan*)	St. Olave Southwark	Male	101	Ditto.
	"	Wandsworth	Female	101	Ditto.
	Kent (*Metropolitan*)	Woolwich	Male	100	Bronchitis.
II.	Surrey	Kingston	Female	100	Old Age.
	Kent	Sevenoaks	Male	107	Ditto.
	"	Eastry	Female	100	Ditto.
	Sussex	Battle	Female	100	Disease of Liver.
	"	Brighton	Male	105	Paralysis.
	"	"	Female	101	Old Age.
	Hampshire	Portsea Island	Male	106	Bronchitis.
	"	Alverstoke	Female	100	Old Age.
	"	Isle of Wight	Female	102	Ditto.
III.	Middlesex	Barnet	Female	101	Ditto.
	Bedfordshire	Biggleswade	Male	101	Ditto.
	Cambridgeshire	Cambridge	Female	100	Ditto.
	"	Linton	Female	100	Ditto.
IV.	Essex	West Ham	Female	105	Bronchitis.
	"	Epping	Female	102	Old Age.
	Suffolk	Sudbury	Male	100	Ditto.
	"	Plomesgate	Male	103	Ditto.
	"	Mutford	Female	103	Ditto.
	Norfolk	Aylsham	Female	101	Ditto.
	"	Norwich	Female	100	Ditto.
	"	Loddon	Female	102	Ditto.
V.	Devonshire	Plympton St. Mary	Male	102	Ditto.
	"	Okehampton	Male	100	Ditto.
	"	"	Male	101	Ditto.
	Cornwall	Liskeard	Female	102	Bronchitis.
	"	Falmouth	Female	100	Old Age.
	"	Redruth	Male	101	Ditto.
	Somersetshire	Dulverton	Male	101	Ditto.
VI.	Gloucestershire	Bristol	Female	101	Ditto.
	Herefordshire	Ledbury	Male	108	Ditto.
	Shropshire	Cleobury Mortimer	Male	100	Ditto.
	Staffordshire	Stafford	Male	101	Angina Pectoris.
	"	Stone	Female	102	Old Age.
	"	Wolstanton	Female	100	Bronchitis.
	"	Burton-upon-Trent	Female	101	Old Age.
	Warwickshire	Foleshill	Male	100	Bronchitis.
VII.	Lincolnshire	Holbeach	Female	103	Old Age.
	Nottinghamshire	Worksop	Female	101	Ditto.
VIII.	Cheshire	Northwich	Female	103	Ditto.
	"	Nantwich	Female	100	Ditto.
	"	Chester	Female	109	Ditto.
	Lancashire	Liverpool	Female	100	Ditto.
	"	West Derby	Male	100	Ditto.
	"	Prescot	Female	100	Ditto.
	"	Chorlton	Female	104	Ditto.
	"	Salford	Female	100	Ditto.
	"	Ashton-under-Lyne	Female	104	Ditto.
	"	Blackburn	Female	102	Bronchitis.
IX.	West Riding	Halifax	Male	100	Old Age.
	North Riding	Whitby	Female	104	Ditto.
	"	Bedale	Female	101	Ditto.
X.	Durham	Stockton	Male	100	Ditto.
	"	Sunderland	Female	101	Ditto.
	Cumberland	Whitehaven	Female	101	Ditto.
XI.	Monmouthshire	Monmouth	Male	102	Ditto.
	"	Bedwelty	Female	100	Ditto.
	Glamorganshire	Pontypridd	Female	101	Ditto.
	"	Swansea	Female	100	Ditto.
	Carmarthenshire	Carmarthen	Male	100	Ditto.
	Pembrokeshire	Haverfordwest	Female	100	Ditto.
	Cardiganshire	Cardigan	Female	102	Ditto.
	Carnarvonshire	Pwllheli	Female	100	Ditto.

Note.—The Table may thus be read :—Of each 1000 male children living under five years of age, 72·6 died in the 34 years 1838–71 ; in the five years 1841–45 this proportion averaged 69·0 per 1000 ; and in the five years 1866–70 it was 73·0.

* The population used in these calculations is deduced from the ascertained rates of increase observed in the 30 years 1841–71 (*see* Table 66, p. cxiv.), distributed in the several groups of ages according to the proportions found to prevail at the four Censuses.

Note.—The Table may thus be read:—Of each 1000 female children living under five years of age, 62·7 died in the 34 years 1838-71; in the five years 1841-45 this proportion averaged 58·8 per 1000; and in the five years 1866-70 it was 63·4.

* The population used in these calculations is deduced from the ascertained rates of increase observed in the 30 years 1841-71 (*see* Table 66, p. cxiv.), distributed in the several groups of ages according to the proportions found to prevail at the four Censuses.

Mean Annual Rate per 1000 in each Quarter -					25·0	22·1	20·7	21·9

* These rates may thus be read, without reference to the decimal points:—In the March quarter of the year 1838, to 10,000 of the population there were 262 deaths registered. A correction has been made in the calculations for the inequality in the number of days in the different quarters, *see* note to Table 6.

TABLE **26.—Proportional Number** of **Deaths** in **England** in each **Quarter** to **1000 Deaths** in the **Average Quarter*** of each of the Thirty-four Years **1838–71.**

* This Table is compiled from the Weekly Returns made by the Registrars of London, and relates to the 52 or 53 weeks of each year. The figures for 1871 will not agree with those given on pages 100-3, which relate to the correct year instead of the 52 weeks; moreover, the same Institutions are not in all cases included in each list.

TABLE **34.—London** and its **Registration Sub-districts. Area** *inclusive* and *exclusive* of TIDAL WATER.

1871 . . .	24·6	22·4	25·6	25·0	26·1	24·0
Average Number living to One Death annually (1840–71) . . .	41	44	44	40	38	41

NOTE.—The populations upon which these rates of mortality have been calculated are deduced from the numbers enumerated at the four Censuses of 1841, 1851, 1861, and 1871. The deaths used are those registered in the complete years.

Certain alterations affecting the West and Central groups of districts were made in the year 1868, but corrections have not been made in the results given in this Table for years prior to 1861.

NOTE.—The numbers for 1837 were registered in the half year ending 31st December.

TABLE **42.—Area,** estimated **Population,** and **Marriages, Births,** and **Deaths** in the **United Kingdom,** in the Year **1871.**

———	AREA IN STATUTE ACRES.	AREA IN HECTARES.	Estimated POPULATION in the middle of the Year 1871.	MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.
UNITED KINGDOM	77,635,182	31,416,707	31,541,347	259,060	518,120	1,102,233	711,348
Great Britain - -	56,815,353	22,991,526	26,150,734	214,078	428,156	913,555	589,523
England and Wales -	37,319,221	15,102,007	22,782,812	190,112	380,224	797,428	514,879
Scotland - - -	19,496,132	7,889,519	3,367,922	23,966	47,932	116,127	74,644
Ireland - - -	20,819,829	8,425,181	5,390,613	44,982*	89,964*	188,678*	121,825*

* The *registered* Marriages, Births, and Deaths for Ireland were 28,960, 151,665, and 88,720 respectively. By the authority of the Registrar General of Ireland these numbers have been corrected in the above table for defective registration. It has been assumed that the marriages, births, and deaths in Ireland in the year 1871 were in the same proportion to population as the marriages, births, and deaths in England and Wales.

TABLE **43.—Proportion** per **1000** of **Marriages, Births,** and **Deaths** to the Population of the **United Kingdom,** in the Year **1871.**

———	ACRES TO A PERSON.	HECTARES TO A PERSON.	To 1000 PERSONS LIVING.			
			MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.
UNITED KINGDOM - -	2·46	·996	8·21	16·4	35·0	22·6
Great Britain - - -	2·17	·879	8·19	16·4	34·9	22·5
England and Wales - -	1·64	·663	8·34	16·7	35·0	22·6
Scotland - - - - -	5·79	2·343	7·12	14·2	34·5	22·2
Ireland - - - -	3·86	1·563	8·34*	16·7*	35·0*	22·6*

Note.—The total area of a country, divided by its population, gives the average area to each person. The reciprocal gives the "density" of the population, or the population to each acre, square mile, or other measure.

* The deaths in Ireland are not all registered; but by the estimate of the Registrar General of Ireland the rate of mortality is nearly the same as that of England. The same may be said of natality.

TABLE **44.—Population, Area, Births,** and **Deaths** in the **Islands** in the **British Seas** in the Twenty-one Years **1851–1871.**

Years.	Islands in the British Seas.		Isle of Man.		Island of Jersey.		Guernsey and adjacent Islands.

* The deaths of soldiers, marines, and seamen from the Royal Navy, who were passengers in British Merchant Ships, were 33 in 1856, 59 in 1857, 156 in 1858, 196 in 1859, 196 in 1860, 69 in 1861, 122 in 1862, 116 in 1863, 96 in 1864, 140 in 1865, 184 in 1866, 97 in 1867, 81 in 1868, 51 in 1869, 27 in 1870, and 24 in 1871. The number is 1,647 in sixteen years, which, if added to the 8,893 above, makes 10,540, the total number of deaths of British subjects at sea in 1856-71, exclusive of those of merchant seamen. The Entries in the "Marine Register" of Births occurring in 1871 were but 80, and of Deaths 204.

In the 20 years 1852–71	3,640,625	77,392	21·3

* Deduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar General of Shipping and Seamen. Since 1867 the return *includes seamen dying ashore in foreign parts*, whose wages and effects are delivered to the consuls or officers of the hospitals on their discharge from their ships.

If a *seaman* die on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel be not to return direct to the United Kingdom. But if a *passenger* die on board a ship which does not return to a British port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given, and in the accompanying tables the births and deaths are classed according to the years in which they occurred. In some passenger-ships women are employed as stewardesses, and are counted as part of the crew. They therefore form part of the strength in this Table, and if the death of a stewardess occur in the course of a voyage, it is included in the column of Deaths.

When a ship is lost with all persons on board, the owners return the number and names of the crew, and the names of the passengers, when known, to the Registrar General of Shipping and Seamen.

TABLE **58.**—RETURN of the AGES, RATING, and CAUSES of DEATHS of **4338 Seamen** reported to the BOARD OF TRADE as having died in the **British Merchant Service** in the Year 1871. (*Parliamentary Return, No.* 169, *Session of* 1872.)

1870	22,501,316	36,985,212	20,385,498	24,635,893
1871	22,782,812	—	—	24,643,874

* M. LEGOYT, late director of the Statistical Department of France, favoured the Registrar General with the returns for France for the years 1853–61 and for the year 1866. The population in the four years 1862–65, and in the years 1867–69 was estimated by means of the average annual rate observed between the two enumerations of 1861 and 1866. The estimate for 1870 has been supplied by the French Government.

† The Registrar-General has, from time to time, been indebted to the Chief of the Statistical Department of Austria for the figures relating to that empire. The population returned above includes Hungary, Croatia, Slavonia, and Transylvania from 1853 to 1862 inclusive; after 1862 the population of those parts of the empire is excluded. Until 1864 the States of Italy were included; since 1864 they are excluded. The apparent decrease in the population between 1868 and 1869, is due to a change in the boundaries of the Empire of Austria and the kingdom of Hungary.

‡ The population of Schleswig-Holstein, Hanover, Hesse, and Nassau is included in and after the year 1867.

* The returns for France since the year 1860 include the three newly annexed departments. The deaths of Frenchmen abroad—civil or military—are registered in the books of the commune in which was their last domicile. M. Legoyt revised the population and the numbers of marriages, births, and deaths for the years 1853–65.

† The returns for Austria include Hungary, Croatia, Slavonia, and Transylvania from 1853 to 1862 inclusive; since 1862 the returns exclude those portions of the empire. Until 1864 the States of Italy were included; since 1864, however, they are excluded.

‡ The returns for Prussia include Schleswig, Hanover, Hesse, and Nassau since 1867. The marriages and births are given throughout for the civil population only; the deaths for 1866, 1870, and 1871 include the military that fell in the wars.

§ Cholera and war.

‖ Cholera was prevalent in France in 1865 and 1866.—(*M. Legoyt.*)

¶ Dr. Ficker attributed the excessive mortality in the year 1866 to cholera and the war.

1871	—	—	—	—	—	—	—	—	—

* The decrease of marriages in 1866 may be attributed to the law which then came into operation removing the civil registration from the parochial authorities to the communes; there had been a marked increase in the previous year resulting from a wish to evade the law about to come into operation. Doubtless many of the marriages solemnized in the churches during 1866 escaped registration.

† The figures for 1870 were supplied by Signore L. Bodio, chief of the Statistical Department in Italy.

1871	—	—	—	—	—	—	—	—	—

NOTE.—The Population enumerated at the Census of 1860 was 15,673,536. The estimated Population for the Years subsequent to 1861 has been deduced from the Excess of Births over Deaths in each Year. This method of estimating the population is sanctioned by the Junta General de Estadistica at Madrid. The decline of registered marriages in 1870 is believed to be due to the introduction of civil registration, which occurred during that year.

1851 -	**27,764,034**	13,656,998	14,107,036
1861 -	**29,358,927**	14,397,427	14,961,500
1871 -	**31,914,985**	15,622,725	16,292,260

* In estimating the number of men in the Army, Navy, and Merchant Service abroad, the proportion belonging to foreign countries and the colonies has been excluded. In 1811 the troops and seamen were 640,500, but as this number included natives of colonies and foreign parts, only 502,536 were taken.

[The above numbers have been deduced by adding to the population of the United Kingdom, as given in Table 62, the enumerated population of the islands in the British Seas, and the Army, Navy, and Merchant Service abroad (*see* p. vii. of Vol. I. Census of England and Wales, 1871.]

* The *Registration Counties* consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the

† These figures have been furnished to the Registrar Gener by the Ordnance Survey Department, and will be found to diff in many instances from those previously published in the Annu Reports. They do not include, as heretofore, space occupied b foreshore or tidal water of rivers and creeks.

‡ As enumerated in April 1871 and revised at the Cens

Act of 6 and 7 Wm. IV. c. 86, in the Year ending December 31st, 1871.

§ Where the parties to a marriage are of different religious ersuasions it sometimes happens that the ceremony is performed according to the rites of both persuasions; in these cases he two ceremonies are entered as two marriages. This column also includes 50 cases of marriage after divorce, viz., 23 *divorced men* who married spinsters, 19 bachelors who married *divorced women*, 1 *divorced man* who married a widow, and 7 widowers who married *divorced women*. For the districts in which these marriages took place, see Table 9, p. lxviii, of Report.

ABSTRACT OF MARRIAGES.—Marriages registered in England, pursuant to

* The *Districts*, which are arranged according to their local position, are collections of contiguous Parishes or Places, generally identical with the Poor Law Unions of the same names.

† As several districts have been amalgamated and new districts have been formed since the numerical arrangement, 1 to 623, was adopted, the Districts have this year been re-numbered consecutively from 1 to 627.

ARRIAGES in the Year 1871—in Districts.

MARRIAGES. Registered in the Quarter ending the last Day of				Contracted between				Of		Of Persons not of Full Age.		Signed the Marriage Register with Marks.		Cases in which		DISTRICTS.

* The district of Kington, which previously to 1st January 1871 was included in the *Registration County* of Radnor, South Wales, has since that date been included in the *Registration County* of Hereford, and is now numbered 343.

† The details of the alteration in the limits of the district of Wrexham on 1st August 1871 are stated in Table 67, page cxvi; the figures above, for the *whole* year, relate to the district as at *present* constituted.

‡ The present number of Superintendent Registrars' districts is 626. The above numerical arrangement 1 to 627 was adopted on 1st January 1871; the number has been reduced by one by the incorporation of Shrewsbury, No. 352, with Atcham, No. 351, on 1st October 1871.

* The *Registration Counties* consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

† These figures have been furnished to the Registrar General by the Ordnance Survey Department, and will be found to differ in many instances from those previously published in the Annual Reports. They do not include, as heretofore, space occupied by foreshore or tidal water of rivers and creeks.

‡ As enumerated in 1871 and revised at the Census Office.

§ Some of the births—especially of illegitimate children in London and large towns—escape registration.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1871—*continued.*

No.	REGISTRATION COUNTIES.	Area in Statute Acres.	Population, 1871.	TOTAL			Births.				Deaths.		Excess of Births over Deaths.

* The *Districts* are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages, and are generally identical with the Poor Law Unions of the same names; they are arranged according to their local position under the Registration Counties. The presence of Institutions in any District is indicated in this column of the Table by *H* for Hospital or Infirmary, *L* for Lunatic Asylum, and *w* for Workhouse situated out of the District to which it belongs; and repetitions of these letters show the number of such Institutions in any District.

† As several districts have been amalgamated and new districts have been formed since the numerical arrangement, 1 to 623, was adopted, the districts have this year been re-numbered consecutively from 1 to 627.

‡ Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths, were, in fact, *less than the Deaths* to the extent stated.

II.—SOUTH EASTERN COUNTIES.—MARRIAGES, BIRTHS, AND DEATHS, 1871—DISTRICTS—*continued.*

No.	DISTRICTS.	Area in Statute Acres.	Population, 1871.	Total Marriages.	Total Births.	Total Deaths.	Births Including Illegitimate Births. Males.	Births Including Illegitimate Births. Females.	Illegitimate Births. Males.	Illegitimate Births. Females.	Deaths. Males.	Deaths. Females.	Excess of Births over Deaths.

* The district of Kington, which previously to 1st January 1871 was counted as belonging to the *Registration County* of Radnor, South Wales, has since that date been included in the *Registration County* of Hereford, and is now numbered 343.
† The details of the alteration in the limits of the district of Wrexham in 1871 are stated in Table 67, page cxvi.
‡ *See* note ‡, page 24.

* Sub-districts are sub-divisions of Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter *W* denotes that the Sub-district contains within its limits a Workhouse belonging to the District or Union; *w* indicates that a Workhouse belonging to *another* District or Union is included; *H* indicates Hospital or Infirmary; and *L* Lunatic Asylum.

† Wherever the minus sign (−) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, *less than the Deaths* to the extent stated. The Excess of *Deaths* over Births is often attributable to the mortality in Institutions. The Deaths in the principal Institutions of England in 1871 are given on pages 99–117.

DEATHS IN PUBLIC INSTITUTIONS,

1871.

THE FOLLOWING PAGES contain the numbers of deaths registered during 1871 in most of the public institutions of England, with the numbers of special inmates enumerated therein at the Census taken in April of that year. These figures afford the means of correcting the mortality of sub-districts and districts where affected by the situation therein of these institutions, through the deaths recorded in them. Workhouses, hospitals, infirmaries, and public lunatic asylums are included, while prisons, almshouses, schools, as well as small private lunatic asylums and benevolent asylums, are generally excluded. The list includes 1,135 institutions; of which 707 are workhouses, workhouse infirmaries, or workhouse schools; 346 hospitals or infirmaries; and 82 lunatic asylums, mostly public county asylums. These institutions exceeded by 101 those included in the list for 1870, of which increase 17 were workhouse establishments, 80 hospitals or infirmaries, and 4 lunatic asylums. The large increase in the number of hospitals was in great measure due to the establishment of many temporary small-pox hospitals during the prevalence of the epidemic of that disease.

Deaths registered in the principal **Public Institutions** of **England** in the **Year 1871.**

* Three deaths were registered in the "Brislington House" private lunatic asylum, situated in this sub-district.

† This Institution is situated partly in Somersetshire and partly in Gloucestershire; as an Institution it is counted as belonging to the latt county, in which the larger portion stands; the deaths, however, are referred to the county in which they actually occurred.

‡ Two deaths were registered in the "Longwood House" private lunatic asylum, situated in this sub-district.

§ Twelve deaths were registered in the "Barnwood House" hospital for the insane (private) situated in this sub-district.

Special Inmates and **Deaths** registered in the principal **Public Institutions** of **England** in the **Year 1871**—*continued.*

NOTE. The Table may be read thus:—Of the 265,563 deaths of Males, 69,699 were those of children under 1 year of age; 20,832 those of the age 1 and under 2 years; 11,206 of the age 5 and under 10 years; 6951 of the age 15 and under 20 years, and so on.

* This column includes the deaths of 25 males registered as aged 100 years and upwards; namely, 9 aged 100, 6 aged 101, 3 aged 102, 2 aged 103, 1 aged 105, 2 aged 106, 1 aged 107, and 1 aged 108. The districts in which these deaths occurred and the cause of death in each case are stated in Table 18, page lxxvii, of Report.

† The *Causes of Death* in England and in London, in combination with the Ages at Death, are given at pp. 144–159.

ENGLAND.—SUPPLEMENTARY TABLE of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all Diseases are classified in the Tables of Causes of Death, pp. 146–149, under 116 heads; some of these heads, however, include groups of diseases which are very distinct from one another, but which either are fatal to only a *few persons*, or are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers

CAUSES of DEATH at different Periods of Life, in the Year 1871.

would not materially interfere with the calculated proportions. Where it is desired, partial correction, however, can be made by means of the following Supplementary Table, containing the deaths from many distinct diseases, such as chicken-pox, mumps, &c. &c., which in the preceding Tables, have no separate classification, and also many of the deaths from various *forms* of disease (such as softening of the brain, *necrencephalus*, deaths from which are included under "*Brain Disease, &c.*") which in some cases are returned under other heads.

APPENDIX.

Letter to the Registrar General on the Causes of Death in England, by William Farr, Esq., M.D., F.R.S.

Year 1871.

Sir,

This year is memorable for an epidemic of small-pox, which ravaged several parts of the kingdom in a way of which there has been no example since the year 1838, when the deaths by small-pox were 16,268. In the 24 consecutive years that ended in 1870, the annual deaths by this disease ranged from 1320 in the year 1861, to 7684 in 1864. The latter number they never exceeded until the year 1871, when the deaths by this single disease ran up to 23,126. The outbreak had all the suddenness of an explosion, for the deaths in the two previous years had been but 1565 and 2620.

The Compulsory Vaccination Act was passed in 1867, and was followed for three years by a period of quiescence of the variolus infection, but it was the quiescence of slumber and not of extinction.

A second Act of Parliament was passed in 1871, and is now in operation.

Under the provisions of the Metropolitan Poor Act of 1867 certain hospitals were provided for the reception of small-pox cases; and the Managers of the Metropolitan Asylum District at the close of the 1870–1–2 epidemic appointed a Committee, consisting of Dr. Brewer, the chairman of the Board, Mr. E. H. Galsworthy, and others, "to report upon the "returns obtained from the several hospitals of the Managers, with regard "to the cases of small-pox treated therein, from the opening of the several "hospitals to the 30th of April 1872." *

The Committee shows that 14,808 patients were treated in the hospitals, where 2763 of them died. The mortality was at the rate of 19 per cent. on the cases treated. Of 903 children under 5 years of age treated, 471, more than the half, or 52 per cent. died. Of children aged 5 and under 10, the mortality was 26 deaths to 100 cases treated; at the age 10—20, the mortality was at the lowest; it was 9 deaths in 100 cases treated: at the 3 higher decenniads 20—50 the mortality (as in other acute diseases) increases to 17, 24, and 29 per cent. The mortality of cases was higher among males than among females at nearly all ages.

11,174 cases occurred in persons vaccinated, 3634 in persons unvaccinated; but to show the relative susceptibility, the reporters properly observe, that the numbers of the two classes exposed to infection should be taken into account. They have apparently made some inquiries on the subject; and say, "it is estimated that, even previously to the com-"mencement of the present epidemic, the vaccinated were about 19 times "as many as the unvaccinated." So that putting x for the number of persons in London unvaccinated, we shall have, if the estimate is correct, this result:—

(1) Out of x *unvaccinated persons*, 3634 attacked were treated in the public hospitals.

(2) Out of $19\,x$ *vaccinated persons*, 11,174 attacked were treated in the public hospitals.

* Metropolitan Asylum District. Report approved by Managers, July 13th, 1872.

So that if we can assume that the (1) unvaccinated, and the (2) vaccinated resort to the hospitals in nearly equal proportions, it will follow that out of the same numbers living more than six times as many unvaccinated were attacked as vaccinated. The treated attacks of the vaccinated, taking numbers into account, to have borne the same proportion to the living, should have amounted to 19 times 3634, or to 69,046. They actually amounted to 11,174.

This point is so important, that looking to the active opposition compulsory vaccination encounters, competent persons should be empowered in epidemics to make full inquiries into the proportions of the population having or not having decisive marks of vaccination; and at the same time arrangements should be made for procuring returns of the actual attacks in the two classes of people.

Upon one point there can be no doubt. Cases of small-pox in persons unvaccinated, and treated after admission with the best skill in the various hospitals, are excessively fatal; 1628 in 3634, that is 45 in 100 such cases end in death.

The vaccinated here again enjoy a relative immunity; yet even of them 1135 cases in 11,174, or 10 in 100 terminated fatally.

Vaccination, therefore, does not afford entire immunity against attack or even death by small-pox: but it unquestionably affords protection to a large extent against attack, and in the event of attack it renders the disease much less fatal than it would otherwise be.

To illustrate the relative protection, assume merely for illustration that in 100,000 *vaccinated people*, 100 are attacked and treated in the hospitals, then, as we have seen, 10 of them die.

Now take 100,000 *unvaccinated people* exposed to nearly the same sources of infection, then, according to the previous data, at least 600 would be attacked and treated, of whom 270 would die.

7912 persons died of small-pox in London alone; and of these deaths 2580 are said to have occurred in persons who had been vaccinated. 3529 deaths occurred in persons not vaccinated; and if the population vaccinated was, to the population unvaccinated, in numbers as 19 to 1, it is evident that if vaccination afforded no protection against small-pox, the deaths of the vaccinated would have been 19 times 3529, or 67,051: they were 2580, so that the chances of death by this disease were reduced in these proportions. This is, moreover, an under-statement, as the greater part of the 1803 deaths, registered without any reference to vaccination, belong to the category of the unvaccinated, for the poor parents naturally feel indisposed to criminate themselves by recording their own negligence.

Vaccination was shown by Mr. J. F. Marson, F.R.C.S., to be a relative term, and to be a matter of degrees: the efficacy of its protection against death by small-pox varying with the quality and the number of scars. The Committee's researches bear this out. Thus they show that the mortality to 100 treated cases of each category was 48 in the patients without marks; 25 in those with one or more bad or indifferent marks; 5 in those with *one* good mark; 4 in those with *two* good marks; 2 in those with *three* good marks; and only one in those with *four or more* good marks. The mortality was 4 in 100 treated of those that had *one or more good marks.* Thus it is the general rule that the mortality is inversely as the marks of vaccination. A point of very great importance is the high rate of mortality in the small-pox hospitals. Dr. Seaton quotes a return by 156 medical practitioners, showing that the deaths in cases which they had met with in the natural form of the disease were about 20 per cent.,* which agrees with Jurin's estimate of one death in five or six cases. Now the deaths of the unvaccinated in these London Hospitals were 45 per cent., double the mortality of cases in private practice where the patients were treated at

* Handbook of Vaccination. By E. Seaton, M.D., p. 191 and 212.

their own homes. And in vaccinated patients suffering from small-pox, while 10 in 100 died in hospital, only 3 in 100, according to the returns of the Epidemilogical Society, died of those treated at their own homes.

Two explanations of the high relative mortality in the hospitals are offered. The first is that the worst cases are taken to the hospitals in undue proportions. This may be the case, but when the characters of the cases treated at home and in hospitals are carefully analysed, as they should be, it will probably be found that the selection against the hospitals is far from accounting for the whole difference. There will remain a residual element: aggravation of the dangers attendant on variolation by the contiguity of patients breathing a common atmosphere. The probability that a man will die by small-pox is increased to some extent by carrying him from healthy quarters to the ward of a small-pox hospital; but at the same time the probability of the diffusion of the disease among the population is much diminished. This, taken in connexion with the fact that many patients are without rooms to themselves, without friends, and so without the means of obtaining help, nutriment, and nursing at home, justifies the policy that has been adopted.

This disease is a type of zymotic diseases; it is induced by a species of matter, which I proposed to call *variolads*, possessing a life of its own, enduring for a definite time; capable of propagation in the bodies of living men, which have not before been subject to the process of variolation; subject to variations of intensity; doomed to decay in the course of a certain number of days in the living body, and in still less time in the body whose natural forces are slain by its usurping domination.

The chances of its extension in the population vary with circumstances; but generally they are increased by proximity, and by dirty habits. An epidemic of small-pox usually commences at one or more central points; which may be interpreted as implying that there, under conditions favourable to their developments, varieties of *variolads* of extraordinary vigor, spring into existence, and are propagated through the usual channels. The English epidemic of 1871 sprang up in the east end of London about the 40th week of 1870. The weekly deaths by small-pox in London had been so low as 2 in the 15th week of that year; they ranged from 9 to 15 between the 27th and 39th week; from 13 to 27 in the next 5 weeks; then suddenly rose to 40 in the 45th week, of which no less than 22 were in the East Districts, including Shoreditch, Bethnal Green, and Whitechapel. By the 52nd week of 1870 the deaths by small-pox in London were 110; of which 47 occurred in the East Districts, while of the 13 in Islington West, where the small-pox Hospital is situate, many probably came also from the East Districts. The epidemic ran up rapidly to 288 in the fifth week of the June quarter.

The epidemic attacked Lancashire immediately, but attained its maximum in the first quarter of 1871. The tenth Division, especially the colliery districts of Durham and Northumberland, suffered severely late in the year. The whole country was more or less affected. In the districts that suffered most vaccination had been most neglected. The distribution of the disease over the kingdom is shown in detail in the Table commencing on p. 184. It may be noticed that in 123 of the 627 Registration Districts no death from small-pox was recorded.

I will now pass in review the fatal diseases of the year in the five classes.

I.—Zymotic Diseases.

The 123,030 deaths by this class of causes, marshalled under four orders, exceeded the average numbers; and the excess was entirely due to small-pox, on which I have already commented. In the previous year the excess was due to the epidemic of scarlet fever. Since the year 1865

diarrhœa has been unusually fatal. The cholera epidemic of 1866 was preceded and followed by epidemics of diarrhœa; and as cholera was propagated through the waters polluted by its specific matter in rivers and wells, it is probable that diarrhœa is distributed through the same medium. In the miasmatic order, scarlet fever, which was at its maximum in 1870, was still a leading disease; but fever was declining. Enteric fever was by far the most fatal of the three forms of continued fever.

Among the enthetic diseases propagated by direct inoculation, syphilis is the most fatal, for to it 1742 deaths were referred. The rate of mortality by this disease is lower than it was in the three previous years; and we may hope to see it still further reduced if proper precautions are taken to stop it at its sources.

Hydrophobia prevailed quite epidemically in this year. Never before did so many die of this distressing disease. The deaths by it in the four years 1868–71 were 7, 18, 32, and 56. Police measures should be taken to stop its progress.

To alcoholism in one form or other 740 deaths were referred; 370 having been registered as *delirium tremens*, and 370 as intemperance. This class of deaths attained the highest pitch in 1865 when 612 deaths by *delirium tremens*, 437 by intemperance were recorded; since that date the deaths have declined.

No doubt many other diseases are indirectly the result of drinking to excess, so that the deaths by alcoholism are understated; but as the relative accuracy of the returns is probably increasing, the fall of the deaths from 1049 in 1865 to 740 in 1871 is evidence of decrease in the bad habit of drunkenness. Certainly these returns lend no countenance to the notion of the increase of intemperance. The parasitic diseases, including thrush as well as worms, were not more fatal than usual.

II.—Constitutional Diseases.

One of the diathetic diseases, gout, is more fatal than *delirium tremens*, and in its various forms is sometimes entered under disguised names. Excess in eating among the higher classes is unquestionably little less fatal than excess in drinking; and the two excesses cannot be too much guarded against by the aspirants after longevity. Scrofula, tabes, hydrocephalus, and phthisis were all below the average rate of their fatality. (*See* Table 10, pp. 244–7.)

III.—Local Diseases.

This is of all classes the most fatal, as it embraces all well defined local affections. The most fatal order embraces the diseases of the respiratory organs; and it is growing yearly more fatal. The death-rate by bronchitis rose from 1188 per million in the years 1850–59 to 1749 in the ten years following, to 2097 in 1870, and to 2112 in 1871; bronchitis under its name is apparently absorbing cases formerly accounted as pneumonia or asthma and perhaps as phthisis. This may be due partially to change of nomenclature and improved pathology, but it is also probably due partly to the imperfect ventilation, and to the dust of mines, shops, and factories.

The deaths by affections of the brain, nerves, and senses vary little from the average; and there is no evident increase; to convulsion fewer deaths were referred than in previous years; yet their number was 25,309. Apoplexy and paralysis and insanity were somewhat more fatal in the year than previously.

Heart disease is occurring more frequently in the returns than it did, and its causes require fuller investigation. It is now fatal to 1 annually in every 1000 living, and the deaths in the last year were 26,219.

Diseases of the digestive organs were not fatal to so many; yet of them 21,621 died, including 8711 by the various affections of the liver.

The diseases of the urinary organs were fatal to 7628 people; those of the organs of generation, locomotion, and the integumentary system together were fatal to only 4616 lives.

IV.—Developmental Diseases.

These are diseases incidental to development, to growth, and to senile decay. 9650 deaths are ascribed to premature birth, 1418 to malformations including 570 by cyanosis, 390 by spina bifida, 458 by other malformations, and 4108 by teething.

The mothers who died in childbirth were 3935; including 1464 by puerperal fever (*metria*) which during the last two years has been more prevalent than it had been since 1864 and 1865 when the disease was epidemic. The excess in the number of 2471 deaths from what have been called the accidents of childbearing tells strongly in favour of the efforts that are being made for the education of the midwives by whom so many of the women of England are attended.

The deaths of children under one year of age amounted to 125,868. No less than 9650 of these were born prematurely; that is, the natural term of intra-uterine life being nine months, during which the organs are matured under favourable circumstances, these, as well as other untimely births, were cast on the world before that period either by some affection of their own system or of their mothers. This number died. A certain number survived. The causes of the deaths of 22,463 are returned as atrophy and debility; these are cases of defective nutrition. Nearly the same number or 20,089 are classed as deaths by convulsions. Then 15,662 of the deaths were by diarrhœa. Thus, adding these numbers together, we have 58,214 deaths of infants from causes by no means clear; by ill-defined diseases; or by diseases which are symptoms either of other diseases or the consequences of improper nutriment.

The deaths of 1224 infants are directly ascribed to the want of breast-milk, and no doubt this is only a small proportion of the numbers who die or are irreparably injured for want of nature's food.

A large number of the deaths of infants were from small-pox, measles, scarlet fever, and whooping cough; scrofula, tabes, phthisis, water on the brain. Bronchitis and pneumonia are two of the other great causes of infant death; to those diseases 18,245 deaths are due.

1723 infants died violent deaths, of which 1568 were returned as accidental, including 1098 infants suffocated, generally by overlaying, as it is called, by the mother, during her sleep.

147 cases of infanticide out of the 125,868 dying were returned by the coroners.

I some time ago determined the rates of mortality among children, and found that England occupied an intermediate place in the scale; in Norway, in the cold North, the mortality was lowest; in Italy, in the warm South, it was highest.

At the same time I was favoured with replies to inquiries respecting the treatment of infants in Scotland, Norway, Sweden, France, and Austria by Dr. Stark, Professor Aschoug, Dr. Berg, M. Legoyt, and Dr. Herz.*

For England I have been favoured with replies to the queries in a valuable paper, for which the country is indebted to the Obstetrical Society of London; and as the paper throws much light on the causes of the infant mortality recorded in the Registrar General's annual reports,

---

* The replies were published in the Statistical Journal of 1866, vol. xxix. pp. 1—35, as an Appendix to the paper on the Mortality of Children in the Principal States of Europe.

statists will be glad to see its principal passages printed as a supplement to this letter.

This question of the treatment of infancy is much larger than it looks at first sight; for every man born goes through this period of initiation. Now in England about 800,000 children are born annually, and by the Life Table 119,594 of them die in the first year, some from congenital weakness and blight, but great numbers, not I conceive from the cruelty of their parents, but either from the necessities of their condition in life, or from their ignorance of the best modes of nursing children. If so many die, 680,406 survive to testify to the thousands of cares they have received from their parents often struggling for subsistence; to bear marks through all life of their treatment during the first year of life. It cannot be doubted that an English child born in London for instance, and nursed by its parents at home, must grow up into a creature very different from the foundling, committed by its parents to the care of the city hospital, who grows up into a French citizen in Paris, or a young Muscovite in Moscow. Even that practice of binding the baby's limbs in bonds from its birth to keep, it is said, the young struggler out of mischief, leaves its traces in the soul; which can scarcely be expected ever after to lead a life of sober liberty. It is to the credit of English women that the barbarous practice is not in use in this kingdom.

Cookery, the preparation of food for adults, is worthy of study, but to the child it is of paramount importance; nature supplies milk for the first months, then art intervenes, takes the nursling in hand, and gradually prepares it for the years of childhood.

V. Violent Deaths.

The number of violent deaths in England is exceedingly great, and it is increasing. The numbers so returned were 11,727 in 1838, 14,040 in 1854, and 16,993 in 1871. A part of the increase is due to increase of population; but correcting for this, the general result is, that in the year 1854 the violent deaths to 1,000,000 living were 759, on which there was no considerable increase until the years 1863–4–5, when the rate of violent deaths rose to 772, 826, and 835; that year, 1865, was the maximum, for through the next five years the rate declined to 745 in 1870, but was 752 in 1871.

By suicide the deaths to the million living were remarkably uniform; 66 in 1858 and 66 in 1871. By homicide, including infanticide, in the same years the rate was 18 and 17, there having been a slight swell up to 23 in the cholera year 1866; executions declined.

The greatest reduction is in the violent deaths by burns and scalds, which fell from 162, 153, and 161 in the years 1858–59–60, to 116 in each of the last two years 1870–1. We may hope to see a further decline in these fearful deaths, of which so many arise from negligence.

The deaths by drowning registered at home have also declined. The numbers drowned at sea were registered by the Registrar General of merchant seamen; they amounted to 2476, of which 1500 happened by wreck, 976 by other accidents or negligences. We may hope to see a still further decline in the deaths from accidents in mines or on railways.

I have the honour to be,
Sir,
Your obedient servant,
WILLIAM FARR.

To
The Registrar General.

Supplement to Dr. Farr's Letter.

REPORT OF THE INFANT MORTALITY COMMITTEE OF THE OBSTETRICAL SOCIETY OF LONDON, 1870.

(*Reprinted in abstract from vol. XI. of Transactions, by permission*).

The President, Dr. W. M. Graily Hewitt, stated that the paper about to be read was of a peculiar character. Some time since Dr. Farr, of the Registrar General's office, communicated to the Society his desire to obtain information* as to the treatment and management of infants in this country, with a view to ascertaining the extent and causes of infant mortality, and requested the Society to use the resources at its disposal for obtaining this information. His request was at once acceded to. The Council appointed a committee on the subject, which since then had been at work. A series of questions was drawn up, printed, and a copy sent to each Fellow. A considerable number of answers had been obtained, and Dr. Gervis, one of the hon. secs. of the Society had, at the request of the committee, drawn up an analysis of the replies thus elicited, and the paper now to be read was the analysis in question. The Council had decided to bring the matter thus far advanced before the Society, the subject being a highly important one, and in order also that those Fellows of the Society who had not yet contributed information on the subject might be induced to do so.

REPORT.

The Committee appointed by the Council of the Obstetrical Society to investigate the causes of Infant Mortality, in presenting to the Fellows the result of their inquiries, while on the one hand, they must express some regret that they were not favoured with a reply to their circular from a larger proportion of the gentlemen to whom it was addressed, on the other hand, cannot but congratulate themselves and the Society on the fact that through the medium of this investigation a very considerable addition has been made to our knowledge of the circumstances attending the birth and early life of infants in various parts of the country, and many valuable suggestions offered from which they trust by the influence of this Society on the public mind much benefit may ultimately accrue.

Question 1.—The first question asked relates to the proportion of births attended by medical men and by women respectively, to the amount of instruction possessed by the women, and to the mode of procedure adopted with the infant immediately after its birth. From the replies given the following general statements are deduced,—that among the poor population of villages a large proportion varying from 30 to 90 per cent., are attended by midwives. Thus, in Flegg-Burgh in Norfolk, with a population of 554, Mr. Waller reports that 30 per cent. are attended by midwives. In Gringley, near Bawtry, Notts, with a population of 874, Mr. Raynes reports the number as 46 per cent., and at Bromyard in Herefordshire, population 1,300, Mr. Marley reports that as many as 90 per cent. are attended by midwives. In the small non-manufacturing provincial towns, on the other hand, attendance by midwives prevails to a much less extent, with a few exceptions. The large majority of the returns puts attendance by midwives in towns of a population of from 6,000 to 10,000, as varying from 5 to 10 per cent., and in some few as not occurring at all, *e.g.* in Lewes, with a population of 3,716, there is stated to be none. In Long Sutton, however, with a population of 6,124, Mr. Ewen reports that attendance by midwives occurs to the extent of 26 per cent.; in Altrincham, in Hampshire, with a population of 6,628, Mr. Blease reports that attendance by midwives reaches as high a figure as 53 per cent. In the large provincial towns, and especially in the large manufacturing towns, attendance by midwives among the labouring population occurs in almost as large a proportion as in the agricultural villages. Thus, in Glasgow the return is 75 per cent., in Coventry, 90 per cent. In Leeds, Sheffield, Birmingham, and Bury, the proportion is not stated in figures, but stated either to be large or the larger, in comparison, *i.e.* with attendance by qualified practitioners. In Wakefield, however, with a population of 23,000, Mr. Fowler reports that, while among the Irish, attendance by women prevails to a very large extent, among the English nearly every

* The following Questions were submitted by Dr. Farr for the purpose of eliciting the required information:—

1. How are children brought into the world? i.e., are the mothers attended by women or by medical men? Are the women instructed? And, if not, what is the mode of procedure with the baby as to umbilical cord, dressing, feeding, covering up, warming, &c.?
2. Are the children suckled by the mother? For how many months? Do they get artificial food, and of what quantity and quality?
3. Describe briefly the life of the baby at ages six and twelve months through the twenty-four hours. The hours of sleep, dressing, washing (with hot or cold water), food, drink, nursing in cradle or otherwise by mothers or maids, going out into the open air, or being shut up in bedrooms, physic, drugs, or spirits?
4. Is there any other matter likely to influence the life; such as accumulation in hospitals, lodgings, &c.?
5. Are children deserted, sent to hospital, or ill-treated? Is infanticide uncommon?

case is attended by a medical man. In Edinburgh, as reported by Dr. Matthews Duncan, attendance by midwives would appear to occur to but a trifling extent. Lastly, from London the reports vary accordingly as they come from the east or west end, or from the suburbs. In the east of London, as Stepney, Barking, and Stratford, it would appear that from 30 to 50 per cent. of the poor are attended by midwives. In the west end, on the other hand, the proportion is very slight; thus, Mr. Curgenven, Dr. Bloxam, and Mr. Gaskoin report that it amounts to 2 per cent. or even less. In a suburb such as Wimbledon, Dr. Payne states the proportion of midwifery attendance by women to average about 5 per cent.

To the question, Are the women instructed? answers in the negative have been received from all parts of the country, with the exception of Glasgow and Sheffield, where Dr. Yeaman and Mr. Hime respectively report a certain amount of education to exist among the better class of midwives. From several districts the replies indicate not merely a want of any special education, but gross ignorance and incompetence, and a complete inability to contend with any difficulty that may occur. In London, on the other hand, it would appear that there are many women practising midwifery who have received a certain amount of instruction at various institutions, but these, although fairly competent in ordinary cases, are also quite unequal to any of the emergencies of Obstetrics.

Under the third section of the first question,—that relating to the mode of procedure with the infant after birth,—nothing of much new interest has been ascertained. The ordinary treatment of the umbilical cord appears to be generally carried out—the only variety being in the length of cord allowed to remain, this varying from one inch to three inches. In reference to the binder fastened around the infant's abdomen, Mr. Curgenven remarks that it is often much too tight, so much so indeed as not infrequently to induce convulsions.

In country districts the custom of giving some aperient to the infant shortly after its birth appears still to be very prevalent, less so in the larger towns, still less in London. The aperient varies much in kind. Butter and sugar, gruel, and castor oil are the most common; but in Chelmsford a favourite dose would appear to be milk and sugar; in Sheffield, treacle; and in Altrincham, a teaspoonful of cold water. No report has been received of any great delay being common in putting the child to the breast. Twenty hours is the longest period mentioned as being allowed to elapse.

Question 2.—The second question has reference to Lactation and Feeding. Among the married poor suckling is evidently the rule, and a large amount of testimony is borne to the fact that it is often unduly protracted, even to eighteen months and two years, for the most part with the hope that it may prevent a rapid recurrence of pregnancy. Illegitimate children among the poor, on the other hand, are rarely suckled; and this, whether entrusted to the grandparents, as is often the case in the manufacturing towns, or put out to nurse by the day, or altogether, as is common in London. These are nearly always wholly brought up on artificial food. Among the married poor also it appears nearly universal to give the child artificial food as well as the breast, and that from a very early date. In both cases, *i. e.* where it only supplements lactation, and where it altogether replaces it, the food is generally improper, either in quality or quantity. It consists for the most part of bread soaked in water or milk, and sweetened, arrowroot. sago, or corn flour, baked flour, and biscuit food; all generally of too substantial a consistency, and too exclusively farinaceous.

Among the upper classes it would appear that the tendency for mothers not to suckle their children is on the increase; but here either wet nurses are employed, or the food during the first few months of its life being much more judiciously arranged, so as to contain a much larger proportion of diluted cow's milk, and a much smaller proportion of the farinacea, the injurious results of improper feeding are not seen as among the lower classes. Mr. Curgenven and others remark that a large number of women in London fail to properly suckle their children through a deficient secretion of milk.

Question 3.—From the answers to the third question, which relates to the mode of life (apart from the subject of their food) adopted for the infants in various districts, no fact of new importance has been elicited; but much that was previously known has been confirmed, and much that is interesting narrated.

Both in agricultural and manufacturing districts it seems to be the custom among the poor to let the infants live to a very large extent in the open air—under the care of elder sisters, often, however, little more than infants themselves; and this out-of-door life they lead would appear to compensate to a considerable extent for the smallness of their rooms at all events by day. In the night, however, the want of due ventilation in the crowded sleeping rooms is a serious evil, and prejudicially affects not only the younger members of the family, but also their seniors. Sleeping is encouraged to the utmost attainable extent, and there is too prevalent a tendency to look upon waking as an indication for food, and should it fail in securing renewed sleep, for cordials, such as gin, or narcotics, such as syrup of poppies, or paregoric. Another plan much adopted to quiet infants is to allow them to remain in their cradles, and to keep them sucking at the bottle for a time much beyond that occupied by the mere meal. The effect of this upon gastric digestion is probably, to some extent at all events, prejudicial, and has attracted the attention of some writers under the head of "fruitless sucking." Washing among

infants appears to be fairly attended to; they get some sort of a wash morning and evening, and generally in warm water. When they pass, however, out of the limits of infancy, the care taken of them in this respect gets much less, though it may be here remarked, and this remark equally applies to all the details of infant life, that the first-born child, as a rule, gets much more care and attention throughout its entire infancy than say the seventh or eighth. As regards dress, the tendency certainly is, both in summer and winter, but especially in winter, to err on the side of insufficiency. Considering the comparative feebleness of the circulation of an infant, and the changeableness of this climate, after it has arrived at the stage of its existence when its clothes are shortened, the scanty nature of its dress is an unquestionable source of internal congestions and consequent disease.

The question of food was chiefly considered under Question 2, but a few particulars are here added. Even where suckling is more or less carried out, as has been stated, it appears to be very general to give some artificial food as well, and stress has been laid upon the too exclusively farinaceous character of that food in the early weeks of the child's life. But in the latter months of the first year errors in diet are even more flagrant, and it is no uncommon thing to hear from the mother, in reply to questioning, "It has, sir, what we have," and on minute inquiry what they have proves to include vegetables, uncooked fruit, meat, salt fish, cheese, heavy pastry, and beer. Under these circumstances it is little to be wondered at that bowel and mesenteric disease, followed by general wasting, is so alarmingly prevalent. Indeed, this question of improper feeding must be held accountable for a very large proportion of the excessive infant mortality which prevails.

On the last topic touched upon in this question—the administration of cordials, medicines, and spirits—a very large amount of testimony comes from nearly every quarter (the chief exception being the agricultural villages), that it is a practice extremely prevalent among the poorer, and especially the operative classes. The only exception to this statement comes from Wakefield, and this may be more apparent than real, where Mr. Fowler reports that systematic dosing with anodynes does not prevail. In all the other large towns the general tenor of the reports is that it is "enormous," and many particulars are given as to the quantities sold by chemists and druggists. Thus, even in a small town like Long Sutton, in Lincolnshire, with a population just over 6,000, one chemist alone sells twenty-five and a half gallons of Godfrey's Cordial annually, and another in the same town six imperial pints weekly.

Besides Godfrey's Cordial, tincture of opium, paregoric, syrup of poppies, and Steedman's Powders are the favourite medicines. As regards the administration of spirits, there is also too much reason to fear that, except in country villages, which in this as in some previous matters appear again to have the advantage, it largely prevails. The spirit chiefly given the children is gin, and in some cases doubtless with the idea of relieving flatulence, but in more with the hope of obtaining its narcotic effect.

Question 4.—The fourth question relates to the immediate effects of putting children out to nurse, and from the answers received it would appear that, except in the case of illegitimate children, and the children of the poorer class of millworkers, this is not a very prevalent practice. In the agricultural districts it scarcely prevails at all. In the northern manufacturing towns the wages of the majority of the operatives is sufficiently good to enable them, not only to have houses of their own, but to maintain their wives at home; when, however, a girl, who is a millworker or a domestic servant, has an illegitimate child, it is almost invariably put out to nurse, and its temporary guardians very frequently are the grandparents. It is rare in these towns for a woman to have more than one nurse-child to take care of. Baby-farming, in the sense of an accumulation of babies in one room or house, does not, indeed, out of London, appear to be much carried on; where it is, in London and its neighbourhood, the testimony is invariable as to its prejudicial effects on the infants. Thus, Dr. Payne, of Wimbledon, writes, "A nursery of "three or four children never does well; the air of the room becomes foul, and they "all droop and fall away in flesh, even with the best food, attendance, and cleanliness." And Mr. Curgenven states that of the illegitimate children put out to nurse in London, 80 per cent. die.

Question 5.—From answers to the fifth question it would appear that in the country there is much less ill-treatment of children, desertion, concealment of birth, and infanticide than in London. In the case of country villages and towns this would appear partly to arise from the willingness of the father to marry the mother of the child where possible. Indeed, in many parts of the country it is the invariable custom for the marriage ceremony not to be sought until advancing pregnancy renders it desirable, and it is often postponed until after the confinement has taken place, as by the infant perchance being stillborn, the chief reason for marrige is removed. Such at all events is the case in many agricultural and mining districts. In the large manufacturing towns this comparative absence of the direct ill-treatment of children is largely due to the absence of shame with which illegitimacy is regarded, it being very common, as mentioned under the last section, for one or other of the grandparents to attend to the illegitimate child or children of the daughter. Of indirect or unintentional ill-treatment, however, there is everywhere much to complain of—ill-treatment, *i. e.* arising from the poverty, ignorance, and intemperance of the parents, from the want of comforts and even necessaries in their homes, and from consequent exposure, insufficient feeding, and neglect. There

is one variety of ill-treatment, or what is equivalent to it, which deserves especial animadversion, and that is the neglect which appears to prevail in some towns to call in medical advice in the case of the illness of the infants until medical advice is useless. Thus, Mr. Fowler of Sheffield writes, "It is quite common for women to defer sending "for medical aid, when their children are ill, until it is almost too late. They do this "quite consciously, and say to the doctor, 'Little un's very bad; you can't do no "good, but we want you to see un in case ought should happen, so as you may give us "a paper.'"

While, however, the intentional ill-treatment of children appears to be but little prevalent, their desertion, especially in the case of illegitimate children, appears much more so. Desertion of families by fathers would appear to arise from intemperance, poverty, and immorality; by mothers it is much rarer, and arises chiefly from immorality, *i. e.* from the forming of an illegal connection with another man. Desertion of illegitimates in London is frequent; the mother being anxious to be rid both of the pecuniary burden connected with the support of the child, and of the evidence of her guilt. She frequently, therefore, leaves the child with the woman who undertakes to nurse it, and the ultimate lot of the child so deserted is either death by slow starvation and neglect, or the workhouse. The same tendency exists in the large provincial towns, but in the smaller ones women cannot move from one part of the town to another without its being known, and unless they leave the town altogether it is much more difficult for them to abandon their children. The same causes too, which in the manufacturing towns influence the question of ill-treatment, influence also the question of desertion, *i. e.* on the one hand the high rate of wages obtained by the millworkers, and on the other shamelessness with which illegitimacy is regarded. An anecdote narrated by Mr. Fowler, of Wakefield, well illustrates this. A woman was asked on her applying for medical aid in her approaching confinement how many children she had had before. She volunteered the following: "Let's see—first wor a chance un; second wor a chance un; third wor all right; this is fourth." Another woman applied to the parish for relief on the birth of her sixth bastard. It was known that she was herself a bastard, and as her mother was there, the question was put to the old lady, "Have you ever had any illegitimate children?" "Yes, your honour, six." "Are you not ashamed of yourself?" "Ashamed, no! I've worked for 'em, and 'ave kep 'em; why should I be ashamed?"

With respect to concealment of birth and infanticide the replies from the country without exception intimate that neither of these crimes are common. Thus, Dr. Holman, of Hurstpierpoint, reports that he is not aware of any case of infanticide having occurred in the town within his experience, and in twenty years but one case of concealment of birth; and Mr. Ewen, of Long Sutton, says that concealment of birth is very uncommon, and that he has heard of but three cases of infanticide in forty years, and more or less similar testimony is borne by all our country Fellows who have replied. On the subject of infanticide in London we are unable from the replies received to give any adequate report. In answer to the question. Is infanticide common? nearly every gentlemen has simply written "no." Yet though this doubtless represents accurately enough the infrequency with which the Fellows of the Society, in their own practice, are brought into contact with infanticide, the reply of Dr. Bloxam probably more nearly represents the truth. Dr. Bloxam writes, "Judging by the frequency of coroner' inquests "on cases in which the child has evidently lived, and death said to occur from apnœa, "I should say yes." Probably a special return on this subject requested from the medical officers of the police force would yield statistics of more exact value.

Question 6.—The first section of the sixth question refers to the annual average of illegitimate births known to the Fellows of the Society in their respective districts, and asks information as to the number of illegitimate children who live over one year. In answer to this question the majority of the gentlemen who have replied have given the number known to them personally, and this would obviously be influenced much by the character and extent of their own practice. Thus, Mr. Marley, of Padstow in Cornwall, writes that out of 233 births attended by him in the preceding year, 22 were illegitimate. Dr. Hewitt, of Winkfield, in five years has had but 3; Dr. Coombs, of Bedford, 7: Mr. Curgenven, 6; Dr. Payne of Wimbledon, 5; Mr. Hall, of Barking Road, 2; and so on. A few gentlemen give averages; thus in the practice of Dr. Mackinder, of Gainsborough, the illegitimate births averaged 9·9 per cent.; of Dr. McVeagh, of Coventry, 5·46 per cent.; of Dr. Blease, of Altrincham, 4 per cent. Other gentlemen send particulars of illegitimate births in the towns irrespective of their own practice. Thus Mr. Fowler reports that in Wakefield from January 2nd, 1863, to January 2nd, 1868, there were 197 illegitimate births registered; in Sheffield, Mr. Hime reports that from 1863 to 1867 inclusive, there were 845 applications made by mothers of illegitimate children to the police, and that out of 510 births in the workhouse in 5 years 303 were illegitimate.

Dr. Yeaman, of Glasgow, reports that in the Glasgow Lying-in Hospital during six months there were 195 deliveries, of which 145 were illegitimate, and that in the same period of 318 out-door cases 36 were illegitimate. At Hurstpierpoint Dr. Holman reported that in five years 1253 births have been registered, of which 49 were illegitimate. Mr. Price reports that in the Leeds Gaol out of 29 births in five years, two thirds have been illegitimate.

To the second portion of this question some more exact replies are given. In Wakefield the report states that 26·22 of the illegitimate children die under one year; in Coventry, 40 per cent.; in Padstow, 50 per cent.; in Bawtry, Mr. Raynes states that the average number of illegitimate births during the last five years has been 8, and that all die under one year; Mr. Snell of Stepney, says that a great many illegitimate children have been under his care, without specifying numbers, and that all have died under one year. Of the 6 cases known to Mr. Curgenven all have died under one year of age; Dr. Mackinder, whose average is just 10 per cent., says very few live over a year; on the other hand, Dr. Hewitt, of Winkfield, says of the three cases which have occurred in his practice all the children are alive and well; Mr. Waller, of Flegg-Burgh, Norfolk, writes—"Although in this county as regards illegitimate births we stand highest but "one, *i. e.* Cumberland, the lives of illegitimates in my district at all events are as good "as of legitimates."

From data such as these not given on any common basis, it is difficult satisfactorily to generalise; still on the whole it would appear with respect to the latter of the two inquiries that in spite of such a striking exception as Padstow, in the strictly rural districts the lives of illegitimate infants are as good as those of the legitimate, that in the manufacturing towns an average of at least 35 per cent. die under one year of age, and that in London we should not be far wrong in placing the per-centage at a much higher figure, probably about 75 per cent.

And with respect to the inquiry as to the frequency of illegitimacy, the returns from Norfolk would appear to confirm the previous impression which obtained as to its pre-eminence in this respect among English counties. In questions of health, rural districts have, so far as our replies extend, on the whole come out well, indeed the best; but on this question of illegitimacy, country towns would appear to have the advantage of them, and even probably London itself. It is, in fact, difficult to decide on this point between sparsely populated agricultural villages and densely populated manufacturing towns. From Scotland the only answers received have been from Edinburgh and Glasgow, and it would appear from them that, as in the case of the English metropolis, so in the case of the Scottish, it has somewhat the advantage over the large manufacturing towns, of which Glasgow may be taken as the representative.

The last topic of the circular, and perhaps the most important, treats of the possibility of preventing so large a mortality among infants, and invites suggestions from the Fellows on the subject. It may be as well to arrange these suggestions under two heads; the first including those suggestions in which all agree; the second those which are advocated by particular Fellows. The first deal chiefly with the questions of food and hygiene. All agree in the importance of mothers suckling their infants for a certain number of months, and in the mischief arising from the practice of giving infants of but a few weeks old solid farinaceous food, not to speak of still coarser fare. Where the mother cannot suckle, whatever the cause, no food beyond milk and water, provided the milk be of a good quality, should be given the infant for at least the first three months. All lay stress upon the importance of improving the education and as speedily as possible the dwellings of the working classes:—the education, so that the infants may not continue to be in so great an extent the victims of ignorance, tradition, and prejudice in the matter both of their food and hygiene; and the homes, so that the effects of overcrowding, want of air and light, and imperfect drainage may be remedied. Abstinence from the unauthorised administration of opiates to the child, and from the habitual indulgence in ardent spirits by the mother, is another point, much and generally insisted upon. Greater cleanliness, better nursing, and a warmer average dress, especially in winter, are other points of general hygienic importance much urged.

The particular suggestions made by several of the Fellows are many of them of considerable value, and will be found in the Transactions of the Society, Vol. XI.

Such are the most noteworthy and practical suggestions offered by those Fellows of the Society who responded to the invitation of the Council. It is evident, therefore, that, broadly speaking, a lessened infant mortality is to be sought, on the one hand, by an improved hygiene, and on the other, by an improved law.

The question of improved hygiene would include not only a well-weighed statement of the typical conditions of feeding, nursing, clothing, and generally caring for infants most favourable for their welfare, but also a consideration of the means best adapted to attain this end, such as the drawing-up and distribution of standard dietaries and printed rules as suggested by Dr. McVeagh and Mr. Heckford, and the regulated education of midwives as suggested by Mr. Hime, Dr. Yeaman, and others. And on this subject, probably, much unanimity would prevail among the Fellows of this Society. On the other question, that of an improved state of the law, more difference of opinion would probably exist not only as to the changes that may be desirable, but as to the best means of inducing the legislature to take action on the subject. Before, therefore, completing their report for Dr. Farr, the committee have thought it best to bring the subject before a meeting of the Society, that they may have the advantage of incorporating with their Report any remarks or suggestions with which they may now be favoured; and they do not hesitate to add that there are few subjects to which the Society could devote its attention and influence more usefully than that which forms the subject of the present inquiry.

APPENDIX TABLES.

TABLE **1.—Deaths** in **England** from **Diphtheria** and **Cynanche Maligna,** at different AGES, in each of the **17 Years 1855–71.**

YEARS.	ALL AGES.	Under 1 Year.	1–	2–	3–	4–	Under 5 Years.	5–	10–	15–	25–	35–	45–	55–	65–	75–	85–	95 and upwards.

inasmuch as the executions recorded in each year are classed in the latter according to the dates of conviction, while the numbers in this Table are placed under the years in which the deaths are registered.

§ The cases of angina membranacea which classed to diphtheria were included with scarlet fever until 1860; for several years prior to that date they were, however, separately distinguished by a marginal note on the ticking sheet, as they have been since 1860, when they were first classed to diphtheria.

* In this part of the Table, which comprises Deaths in 1854–57, the Violent Deaths are not distinguished according to ORDERS, &c., but are placed indiscriminately in the next line following.

† In the years 1854–57 cases of so-called "debility" and "premature birth" were classed together; when the new classification was introduce "premature birth" was kept apart, and "atrophy" and "debility" were thrown into one line. The figures for premature birth, and atrophy a debility, given in Table 7 on pages 234–9, have been estimated for each year prior to 1858 from the proportion which the two headings bear t each other in the subsequent years when they were separately distinguished.

‡ For the years 1858–71 the deaths of which the cause was not specified have been distributed pro ratâ over all the causes in the Table.

TABLE 9.—**Causes of Death in England in 1871.** Proportional Numbers dying from each Class of Causes, and from each Cause.

* The rates given in this Table for the various groups of years are the means of the calculated rates in the several years. Under some of separate headings the means cannot be given for the entire period, as the classification in full detail has not been made during the whole 22 yea In a certain number of cases in each year the cause of death is not stated; in calculating the proportional numbers since 1858 these have b distributed pro rata over all the causes in the Table.

† Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

BLE **10.*** (*continued.*)—**Mean Annual Rate** of **Mortality** in **England** from each CLASS of CAUSES and from each CAUSE of DEATH during the **20 Years 1850–69,** and in each **Decade** and **Quinquennial** of that Period; also the **Rate** of **Mortality** in the Years **1870** and **1871.**

* Tables 19 and 20 are reprinted from "Annual Summary" for 1871.

TABLE **21.—Deaths** and **Death-rate** from **Heart Disease** in **England** in the FOUR QUINQUENNIAL PERIODS between **1851** and **1870,** and also in the Year **1871.**

MALES.

QUINQUENNIAL PERIODS.	DEATHS AT DIFFERENT AGES.					ANNUAL RATE PER 1000 LIVING.				
	All Ages.	0–20	20–45	45–65	65 and upwrds.	All Ages.	0–20	20–45	45–65	65 and upwrds.
1851—1855	32,617	4,416*	6,454†	11,873	9,874	·725	·177*	·553†	1·829	5·065
1856—1860	39,678	3,433	8,723	14,629	12,893	·836	·156	·529	2·137	6·268
1861—1865	49,738	3,942	11,128	18,662	16,006	·993	·169	·605	2·583	7·381
1866—1870	57,687	4,296	13,089	21,132	19,170	1·085	·174	·709	2·757	8·329
1871	12,911	925	2,981	4,773	4,232	1·164	·178	·788	2·968	8·603

FEMALES.

QUINQUENNIAL PERIODS.	DEATHS AT DIFFERENT AGES.					ANNUAL RATE PER 1000 LIVING.				
	All Ages.	0–20	20–45	45–65	65 and upwrds.	All Ages.	0–20	20–45	45–65	65 and upwrds.
1851—1855	33,497	4,784*	6,719†	12,165	9,829	·713	·171*	·530†	1·780	4·232
1856—1860	41,095	3,610	9,349	14,930	13,206	·825	·164	·516	2·061	5·361
1861—1865	51,243	4,153	11,025	18,897	17,168	·970	·178	·573	2·454	6·568
1866—1870	60,003	4,632	12,711	21,588	21,072	1·067	·187	·621	2·632	7·574
1871	13,308	982	2,716	4,906	4,704	1·138	·189	·653	2·818	8·025

* These figures relate to the ages 0–25, as in the abstracts for the quinquenniad 1851–55 the deaths of persons aged 15–25 were classified together.

† These figures relate to the ages 25–45 for the five years 1851–55, as it is not possible to obtain separately the deaths of persons aged 15–20 and 20–25 during that quinquenniad.

INDEX OF DISTRICTS.

[The following Index furnishes a reference to the *Number* of each REGISTRATION DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report. The alphabetical arrangement places compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A.]

In consequence of numerous alterations (amalgamations of districts and formations of new districts) since the numerical arrangement, 1 to 623, was adopted, the districts have this year (1871) been re-numbered consecutively from 1 to 627.*

For names of Towns, such as Leamington, Torquay, &c., which are not found in this "Index of Districts," see the "Index of Sub-districts" (page 261) *and "Index of certain Towns"* (page 271).

A

Aberayron, 600.
Abergavenny, 579.
Aberystwith, 601.
Abingdon, 114.
Alcester, 398.
Alderbury (Salisbury), 254.
Alnwick, 560.
Alresford, 104.
Alston, 565.
Alton, 105.
Altrincham, 447.
Alverstoke, 88.
Amersham, 139.
Amesbury, 253.
Ampthill, 172.
Andover, 109.
Anglesey, 627.
Ashborne, 440.
Ashby-de-la-Zouch, 407.
Ashton-under-Lyne, 468.
Aston, 388.
Atcham (Shrewsbury) 351.
Atherstone, 390.
Auckland, 543.
Axbridge, 315.
Axminster, 269.
Aylesbury, 142.
Aylsham, 223.
Aysgarth, 537.

B

Bakewell, 442.
Bala, 620.
Banbury, 154.
Bangor, 625.
Barnet, 127.
Barnsley, 505.
Barnstaple, 285.
Barrow-upon-Soar, 409.
Barton-upon-Irwell, 464.
Basford, 431.
Basingstoke, 107.
Bath, 317.
Battle, 68.
Beaminster, 267.
Bedale, 535.
Bedford, 170.
Bedminster, 319.
Bedwelty, 580.
Belford, 561.
Bellingham, 558.
Belper, 439.
Berkhampstead, 138.
Berwick, 562.
Bethnal Green, 15.
Beverley, 518.
Bicester, 150.
Bideford, 287.
Biggleswade, 171.
Billericay, 190.
Billesdon, 403.
Bingham, 436.
Birkenhead, 454.
Birmingham, 387.
Bishop Stortford, 130.
Blaby, 404.
Blackburn, 474.
Blandford, 260.
Blean, 57.
Blofield, 228.
Blything, 216.
Bodmin, 294.
Bolton, 462.
Bootle, 573.
Bosmere, 211.
Boston, 418.
Bourn, 415.
Brackley, 155.
Bradfield, 117.
Bradford-on-Avon, 249.
Bradford (Yorkshire), 496.
Braintree, 199.
Bramley, 499.
Brampton, 567.
Brecknock, 604.
Brentford, 125.
Bridge, 55.
Bridgend, 586.
Bridgnorth, 348.
Bridgwater, 307.
Bridlington, 524.
Bridport, 268.
Brighton, 76.
Bristol, 320.
Brixworth, 161.
Bromley, 40.
Bromsgrove, 385.
Bromyard, 341.
Buckingham, 145.
Builth, 603.
Burnley, 472.
Burton-upon-Trent, 368.
Bury, 463.
Bury St. Edmunds, 206.

C

Caistor, 425.
Calne, 245.
Camberwell, 25.
Cambridge, 178.
Camelford, 290.
Canterbury, 56.
Cardiff, 583.
Cardigan, 597.
Carlisle, 569.
Carmarthen, 593.
Carnarvon, 624.
Castle Ward, 555.
Catherington, 102.
Caxton, 176.
Chapel-en-le-Frith, 443.
Chard, 309.
Cheadle, 366.
Chelmsford, 191.
Chelsea, 2.
Cheltenham, 335.
Chepstow, 577.
Chertsey, 30.
Chester, 452.
Chesterfield, 441.
Chester-le-Street, 549.
Chesterton, 177.
Chichester, 83.
Chippenham, 244.
Chipping Norton, 153.
Chipping Sodbury, 322.
Chorley, 475.
Chorlton, 465.
Christchurch, 92.
Church Stretton, 346.
Cirencester, 331.
Cleobury Mortimer, 347.
Clifton, 321.
Clitheroe, 473.

* Thus, the number of Marriages in the Aberayron District may at once be ascertained by referring to the "*Abstract of Marriages*," District number 600 (see page 24); and the numbers of Births and Deaths, of Deaths at different Ages, &c. will be found by referring to the same district number in the appropriate Tables.

Clun, 345.
Clutton, 316.
Cockermouth, 571.
Colchester, 195.
Congleton, 450.
Conway, 626.
Cookham, 120.
Corwen, 619.
Cosford, 204.
Coventry, 393.
Cranbrook, 51.
Crediton, 282.
Crickhowell, 605.
Cricklade, 242.

INDEX OF SUB-DISTRICTS.

[This alphabetical arrangement places the Registration Sub-Districts (or Registrars' Districts) having *compound names* in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not under G; St. James under the letter S, and not as "James, St." The number against each Sub-District, in the third column, refers to its numerical place in the Tables of Abstracts; thus, Abbey Holme (570; 2) is the 2d Sub-District of the Wigton District, No. 570.]

Sub-District.	District.	No.
A		
Abbey	Bath	317; 3
Abbey Holme	Wigton	570; 2
Abbots Bromley	Uttoxeter	367; 2
Abbotsbury	Weymouth	264; 4
Abbots Langley	Watford	136; 4

TO

REGISTRAR-GENERAL'S THIRTY-FOURTH ANNUAL REPORT AND APPENDIX.

PAGES

AGES; of Persons married in 1871 . . . . . xi–xii

Mean Age at Marriage xii

Deaths of Males and Females registered at different Ages in England in each of the Years 1838–71. (Tables 19, 20, pp. lxxviii–lxxix.) xvii

Mortality of Males and Females at different Ages in England in the Years 1838–71. (Tables 21–24, pp. lxxx–lxxxiii.)

of 270,028 Persons married in 1871, distinguishing Bachelors, Spinsters, Widowers, Widows 26–28

at Death of Males and Females registered in 1871 in Divisions, Counties, and Districts 120–141

at Death of Males and Females in England registered from different Causes, in 1871 144–149

at Death of Males and Females in England registered from different Supplemental Causes, in 1871 150–153

at Death of Males and Females in London registered from different Causes, in 1871 154–159

ALCOHOLISM. *See* Intemperance and Delirium Tremens.

AMSTERDAM; Mortality from all Causes in 1871 lv

AREA in Statute Acres of each Division, County, District, and Sub-district . 30–84

of the sub-districts of London, *inclusive* and *exclusive* of Tidal Water (Table 34, p. xci.)

ARMY; Strength and Mortality in the Army at home and abroad. (Tables 48–54, pp. civ–cvi.) xxiv

Average Strength of the British Army at Home in 1871. (Table 48, p. civ.) xxiv

Mortality of the Army at Home in 1871. (Table 49, p. civ.) . xxiv

Average Strength of the British Army Abroad in each of the Years 1868–71. (Table 50, p. civ.)

Number of Deaths in the British Army at Home and Abroad, 1868–71. (Table 51, p. cv.)

Annual Rate of Mortality per 1000 amongst Officers and Men in the Army Abroad, 1858–71. (Table 52, p. cv.)

Strength at Home and Abroad in 1861, showing the Numbers born in the different parts of the United Kingdom and elsewhere. (Table 53, p. cv.)

Deaths of Officers and Men in Army Abroad belonging to Great Britain and to England and Wales, 1858–71. (Table 54, p. cvi.)

Annual Rate of Mortality per 1000 in Great Britain, England, France, Austria, Prussia, and Italy, including the Deaths of Soldiers *at Home and Abroad*, 1857–71. (Table 60, p. cx.)

PAGES

AUSTRIA; Annual Rate of Mortality per 1000 in the Austrian Army, 1857–70. (Table 55, p. cvi.)

Estimated Population in middle of the Years 1853–70. (Table 59, p. cx.)

Annual Rate of Mortality per 1000, *including* Deaths of Soldiers at Home and Abroad, 1857–70 (Table 60, p. cx.)

Number, and Proportion per 1000 of the Population, of Marriages, Births, and Deaths, in each of the Years 1853–70. (Table 61, p. cxi.)

BERLIN; Weekly Returns for 1871 incomplete on account of the War . lv

BIRTHS in 1871 xv

of the two Sexes xvi

out of wedlock, proportions in various counties xvi

proportion of, in the different seasons xvii

in quarter ending March 1871 xxviii

in quarter ending June „ xxxii

in quarter ending September „ xxxvii

in quarter ending December „ xlii

registered in England, in each Year, 1838–71. (Table 1, p. lx.) .

proportion to Population in each Year, 1838–71. (Table 2, p. lxi.)

Legitimate and Illegitimate in England in 1842 and in each Year 1845–71, and Proportion of Males to Females. (Table 10, p. lxix.)

proportion of Illegitimate Children to every 100 Births in the several counties of England, 1852–71. (Table 11, p. lxx.)

registered in England, and proportion to Population, in each Quarter of the Years 1838–71. (Table 12, p. lxxi.) xvii

proportional Number of Births in each Quarter to 1,000 Births in the average Quarter, 1838–71. (Table 13, p. lxxii.)

in Counties, in 1871. Numbers, Sex, Legitimate and Illegitimate; Proportions of Male to Female Births, Legitimate and Illegitimate; Proportion of Illegitimate Births to Total Births. (Table 14, p. lxxiii) . . . . . xv–xvi

proportion of Male and Female Children born in the several Counties of England during each of the Years 1861–71. (Table 15, p. lxxiv.)

proportion to Population in Counties for each of the Years 1861–71. (Table 16, p. lxxv.)

registered in each of the Divisions, Counties, Districts, and Sub-districts in 1871, distinguishing Males and Females . . 30–84

excess of, over Deaths in each of the Divisions, Counties, Districts, and Sub-districts in 1871 30–84

registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1871 . . . 86–89

of Children born out of Wedlock registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1871 90–93

BIRTH-RATE in England, 1851–60, 1861–70, and in 1871 xv

in England in each Quarter of the Years 1838–71. (Table 12, p. lxxi.)

in Counties in each of the Years 1861–71. (Table 16, p. lxxv.)

BOMBAY; Deaths, &c. in 1871 lv

BRONCHITIS; Mortality from 222

BURNS AND SCALDS; Deaths and Mortality at different Ages, in the Years 1848–67, and in each of the Years 1868–71. (Table 16.—App.) 251

PAGES

CALCUTTA; Population; Deaths from All Causes and from Remittent Fever in 1871 lv

CAUSES of DEATH of Males and Females in England, at different Periods of Life, in 1871 144–149

(Supplementary Table) of Males and Females in England, at different Periods of Life, in 1871 150–153

of Males and Females in London at different Periods of Life, in 1871 154–159

of Males and Females in England, and in each of the Divisions and Counties, in 1871 160–183

(from certain zymotic and other Causes) in 1871, in the Divisions, Counties, and Districts of England 184–195

Dr. Farr's Letter to the Registrar General thereon (with Supplement on Infant Mortality) 219–229

registered in England in each of the Five Years 1838–42, and in the 25 Years 1847–71. (Table 7.—App.) . . 234–239

Mortality from, to 1,000,000 persons living, in each of the Years 1854–71. (Table 8.—App.) 240–242

proportional Numbers dying from each Cause in 1871. (Table 9. —App.) 243

Mean Annual Rate of Mortality from different Causes during the 20 years 1850–69, and in each Decade and Quinquennium of that period; in 1870, and in 1871. (Table 10.—App.) . . 244–247

in England, in 1871, arranged in the order of their fatality. (Table 11.—App.) 248

CENTENARIANS; deaths of reputed (Table 18, p. lxxvii.); Number said to be living at Census of 1871 . . . . . xviii–xix

CHILDBIRTH; excessive number of Deaths from 223

Deaths in 1871, at different Ages, of Women after Childbearing, classed under different Diseases, and neither referred to Childbirth nor to Metria in the Abstracts. (Table 12.—App.) . 249

Deaths of Women in 1871 who were returned as pregnant, classed under certain Diseases. (Table 13.—App.) 250

Deaths of Women from Metria and Childbirth in the 25 Years, 1847–71, and proportional Deaths of Mothers to 10,000 Children born alive. (Table 14.—App.) 250

CHILDREN; Causes of death of, under one year of age 223

Mortality of, in England as compared with other Countries . . 223

Treatment of, at and after birth in England and other Countries . 223–224

Report of Committee of the Obstetrical Society on Mortality and Treatment of (1870) 225–229

CHOLERA: The epidemic of 1866 the probable cause of the large number of Deaths from Diarrhœa 222

CONSTITUTIONAL DISEASES 222

CYNANCHE MALIGNA and DIPHTHERIA; Deaths in England at different Ages in each of the Years, 1855–71. (Table 1.—App.) . . 230

DEATHS in 1871 xvii

excess of Births over xvii

proportion to Population xvii

of the two Sexes at different ages in 1871 and 1861–70 . . xvii–xviii

Mortality at different Ages of Males and Females . . . . xvii–xviii

of reputed Centenarians xviii

Meteorology and Mortality xix

in the four Seasons xix

Locality; Divisions, Counties, Urban and Rural Districts . . xix–xx
